[36634] Nucleotide sequences of the VGAM2620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2620 are further described hereinbelow with reference to Table 1.

[36635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36636] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2621 (VGAM2621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36637] VGAM2621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2621 was detected is described hereinabove with reference to Figs. 2-8.

[36638] VGAM2621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36639] VGAM2621 gene, herein designated VGAM GENE, encodes a VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2621 precursor RNA is designated SEQ ID:1253, and is provided here-

inbelow with reference to the sequence listing part.

[36640] VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36641] An enzyme complex designated DICER COMPLEX, dices the VGAM2621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2621 RNA is designated SEQ ID:4323, and is provided hereinbelow with reference to the sequence listing part.

[36642] VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36643] VGAM2621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2621 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2621 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36644] The complementary binding of VGAM2621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2621 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36645] It is appreciated that VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2621 host target genes. The mRNA of each one of this plurality of VGAM2621 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2621 RNA, herein designated VGAM RNA, and which when bound by VGAM2621 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2621 host target proteins.

[36646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2621 gene, herein designated VGAM GENE, on one or more VGAM2621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36647] It is yet further appreciated that a function of VGAM2621 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2621 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2621 correlate with, and may be deduced from, the identity of the host target genes which VGAM2621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36648] Nucleotide sequences of the VGAM2621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2621 are further described hereinbelow with reference to Table 1.

[36649] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36650] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2622 (VGAM2622) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36651] VGAM2622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2622 was detected is described hereinabove with reference to Figs. 2-8.

[36652] VGAM2622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36653] VGAM2622 gene, herein designated VGAM GENE, encodes a VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2622 precursor RNA is designated SEQ ID:1254, and is provided hereinbelow with reference to the sequence listing part.

[36654] VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36655] An enzyme complex designated DICER COMPLEX, dices the VGAM2622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2622 RNA is designated SEQ ID:4324, and is provided hereinbelow with reference to the sequence listing part.

[36656] VGAM2622 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36657] VGAM2622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2622 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2622 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36658] The complementary binding of VGAM2622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2622 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36659] It is appreciated that VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2622 host target genes. The mRNA of each one of this plurality of VGAM2622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2622 RNA, herein designated VGAM

RNA, and which when bound by VGAM2622 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2622 host target proteins.

[36660] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2622 gene, herein designated VGAM GENE, on one or more VGAM2622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36661] It is yet further appreciated that a function of VGAM2622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2622 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2622 correlate with, and may be deduced from, the identity of the host target genes which VGAM2622 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36662] Nucleotide sequences of the VGAM2622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2622 are further described hereinbelow with reference to Table 1.

[36663] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2622 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36664] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2623 (VGAM2623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36665] VGAM2623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2623 was detected is described hereinabove with reference to Figs. 2-8.

[36666] VGAM2623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36667] VGAM2623 gene, herein designated VGAM GENE, encodes a VGAM2623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2623 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2623 precursor RNA is designated SEQ ID:1260, and is provided hereinbelow with reference to the sequence listing part.

[36668] VGAM2623 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36669] An enzyme complex designated DICER COMPLEX, dices the VGAM2623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2623 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2623 RNA is designated SEQ ID:4330, and is provided hereinbelow with reference to the sequence listing part.

[36670] VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36671] VGAM2623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2623 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2623 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36672] The complementary binding of VGAM2623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2623 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36673] It is appreciated that VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2623 host target genes. The mRNA of each one of this plurality of VGAM2623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2623 RNA, herein designated VGAM RNA, and which when bound by VGAM2623 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2623 host target proteins.

[36674] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2623 gene, herein designated VGAM GENE, on one or more VGAM2623 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36675] It is yet further appreciated that a function of VGAM2623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2623 include diagnosis, prevention and

treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2623 correlate with, and may be deduced from, the identity of the host target genes which VGAM2623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36676] Nucleotide sequences of the VGAM2623 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2623 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2623 are further described hereinbelow with reference to Table 1.

[36677] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2623 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36678] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2624 (VGAM2624) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36679] VGAM2624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2624 was detected is described hereinabove with reference to Figs. 2-8.

[36680] VGAM2624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human coronavirus 229E. VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36681] VGAM2624 gene, herein designated VGAM GENE, encodes a VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2624 precursor RNA is designated SEQ ID:2699, and is provided hereinbelow with reference to the sequence listing part.

[36682] VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2624 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36683] An enzyme complex designated DICER COMPLEX, dices the VGAM2624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2624 RNA is designated SEQ ID:5769, and is provided hereinbelow with reference to the sequence listing part.

[36684] VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2624 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36685] VGAM2624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2624 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36686] The complementary binding of VGAM2624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2624 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36687] It is appreciated that VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2624 host target genes. The mRNA of each one of this plurality of VGAM2624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2624 RNA, herein designated VGAM RNA, and which when bound by VGAM2624 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2624 host target proteins.

[36688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2624 gene, herein designated VGAM GENE, on one or more VGAM2624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36689] It is yet further appreciated that a function of VGAM2624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2624 include diagnosis, prevention and treatment of viral infection by Human coronavirus 229E.

Specific functions, and accordingly utilities, of VGAM2624 correlate with, and may be deduced from, the identity of the host target genes which VGAM2624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36690] Nucleotide sequences of the VGAM2624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2624 are further described hereinbelow with reference to Table 1.

[36691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36692] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2625 (VGAM2625) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[36693] VGAM2625 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2625 was detected is described hereinabove with reference to Figs. 2-8.

[36694] VGAM2625 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Northern cereal mosaic virus. VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36695] VGAM2625 gene, herein designated VGAM GENE, encodes a VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2625 precursor RNA is designated SEQ ID:1261, and is provided hereinbelow with reference to the sequence listing part.

[36696] VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2625 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36697] An enzyme complex designated DICER COMPLEX, dices the VGAM2625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2625 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2625 RNA is designated SEQ ID:4331, and is provided hereinbelow with reference to the sequence listing part.

[36698] VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2625 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36699] VGAM2625 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2625 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2625 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36700] The complementary binding of VGAM2625 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2625 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2625 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36701] It is appreciated that VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2625 host target genes. The mRNA of each one of this plurality of VGAM2625 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2625 RNA, herein designated VGAM RNA, and which when bound by VGAM2625 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2625 host target proteins.

[36702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2625 gene, herein designated VGAM GENE, on one or more VGAM2625 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36703] It is yet further appreciated that a function of VGAM2625 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2625 include diagnosis, prevention and treatment of viral infection by Northern cereal mosaic virus. Specific functions, and accordingly utilities, of VGAM2625 correlate with, and may be deduced from, the identity of the host target genes which VGAM2625 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36704] Nucleotide sequences of the VGAM2625 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2625 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2625 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2625 are further described hereinbelow with reference to Table 1.

[36705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2625 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36706] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2626 (VGAM2626) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36707] VGAM2626 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2626 was detected is described hereinabove with reference to Figs. 2-8.

[36708] VGAM2626 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36709] VGAM2626 gene, herein designated VGAM GENE, encodes a VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2626 precur-

sor RNA is designated SEQ ID:1262, and is provided hereinbelow with reference to the sequence listing part.

[36710] VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36711] An enzyme complex designated DICER COMPLEX, dices the VGAM2626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2626 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2626 RNA is designated SEQ ID:4332, and is provided hereinbelow with reference to the sequence

listing part.

[36712] VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36713] VGAM2626 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2626 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2626 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36714] The complementary binding of VGAM2626 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2626 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2626 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36715] It is appreciated that VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2626 host target genes. The mRNA of each one of this plurality of VGAM2626 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2626 RNA, herein designated VGAM RNA, and which when bound by VGAM2626 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2626 host target proteins.

[36716] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2626 gene, herein designated VGAM GENE, on one or more VGAM2626 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36717] It is yet further appreciated that a function of VGAM2626

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2626 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2626 correlate with, and may be deduced from, the identity of the host target genes which VGAM2626 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36718] Nucleotide sequences of the VGAM2626 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2626 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2626 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2626 are further described hereinbelow with reference to Table 1.

[36719] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2626 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36720] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2627 (VGAM2627) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36721] VGAM2627 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2627 was detected is described hereinabove with reference to Figs. 2-8.

[36722] VGAM2627 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36723] VGAM2627 gene, herein designated VGAM GENE, encodes a VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2627 precursor RNA is designated SEQ ID:2709, and is provided here-

inbelow with reference to the sequence listing part.

[36724] VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36725] An enzyme complex designated DICER COMPLEX, dices the VGAM2627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2627 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2627 RNA is designated SEQ ID:5779, and is provided hereinbelow with reference to the sequence listing part.

[36726] VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36727] VGAM2627 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2627 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2627 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36728] The complementary binding of VGAM2627 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2627 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2627 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36729] It is appreciated that VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2627 host target genes. The mRNA of each one of this plurality of VGAM2627 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2627 RNA, herein designated VGAM RNA, and which when bound by VGAM2627 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2627 host target proteins.

[36730] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2627 gene, herein designated VGAM GENE, on one or more VGAM2627 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36731] It is yet further appreciated that a function of VGAM2627 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2627 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2627 correlate with, and may be deduced from, the identity of the host target genes which VGAM2627 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36732] Nucleotide sequences of the VGAM2627 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2627 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2627 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2627 are further described hereinbelow with reference to Table 1.

[36733] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2627 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36734] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2628 (VGAM2628) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36735] VGAM2628 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2628 was detected is described hereinabove with reference to Figs. 2-8.

[36736] VGAM2628 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36737] VGAM2628 gene, herein designated VGAM GENE, encodes a VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2628 precursor RNA is designated SEQ ID:2695, and is provided hereinbelow with reference to the sequence listing part.

[36738] VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36739] An enzyme complex designated DICER COMPLEX, dices the VGAM2628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2628 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2628 RNA is designated SEQ ID:5765, and is provided hereinbelow with reference to the sequence listing part.

[36740] VGAM2628 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36741] VGAM2628 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2628 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2628 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36742] The complementary binding of VGAM2628 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2628 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2628 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36743] It is appreciated that VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2628 host target genes. The mRNA of each one of this plurality of VGAM2628 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2628 RNA, herein designated VGAM

RNA, and which when bound by VGAM2628 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2628 host target proteins.

[36744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2628 gene, herein designated VGAM GENE, on one or more VGAM2628 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36745] It is yet further appreciated that a function of VGAM2628 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2628 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2628 correlate with, and may be deduced from, the identity of the host target genes which VGAM2628 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36746] Nucleotide sequences of the VGAM2628 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2628 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2628 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2628 are further described hereinbelow with reference to Table 1.

[36747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2628 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36748] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2630 (VGAM2630) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36749] VGAM2630 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2630 was detected is described hereinabove with reference to Figs. 2-8.

[36750] VGAM2630 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36751] VGAM2630 gene, herein designated VGAM GENE, encodes a VGAM2630 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2630 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2630 precursor RNA is designated SEQ ID:2696, and is provided hereinbelow with reference to the sequence listing part.

[36752] VGAM2630 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36753] An enzyme complex designated DICER COMPLEX, dices the VGAM2630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2630 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2630 RNA is designated SEQ ID:5766, and is provided hereinbelow with reference to the sequence listing part.

[36754] VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36755] VGAM2630 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2630 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2630 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2630 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36756] The complementary binding of VGAM2630 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2630 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2630 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36757] It is appreciated that VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2630 host target genes. The mRNA of each one of this plurality of VGAM2630 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2630 RNA, herein designated VGAM RNA, and which when bound by VGAM2630 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2630 host target proteins.

[36758] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2630 gene, herein designated VGAM GENE, on one or more VGAM2630 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36759] It is yet further appreciated that a function of VGAM2630 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2630 include diagnosis, prevention and

treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2630 correlate with, and may be deduced from, the identity of the host target genes which VGAM2630 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36760] Nucleotide sequences of the VGAM2630 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2630 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2630 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2630 are further described hereinbelow with reference to Table 1.

[36761] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2630 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36762] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2631 (VGAM2631) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36763] VGAM2631 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2631 was detected is described hereinabove with reference to Figs. 2-8.

[36764] VGAM2631 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36765] VGAM2631 gene, herein designated VGAM GENE, encodes a VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2631 precursor RNA is designated SEQ ID:2701, and is provided hereinbelow with reference to the sequence listing part.

[36766] VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2631 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36767] An enzyme complex designated DICER COMPLEX, dices the VGAM2631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2631 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2631 RNA is designated SEQ ID:5771, and is provided hereinbelow with reference to the sequence listing part.

[36768] VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2631 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36769] VGAM2631 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2631 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2631 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36770] The complementary binding of VGAM2631 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2631 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2631 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36771] It is appreciated that VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2631 host target genes. The mRNA of each one of this plurality of VGAM2631 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2631 RNA, herein designated VGAM RNA, and which when bound by VGAM2631 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2631 host target proteins.

[36772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2631 gene, herein designated VGAM GENE, on one or more VGAM2631 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36773] It is yet further appreciated that a function of VGAM2631 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2631 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific

functions, and accordingly utilities, of VGAM2631 correlate with, and may be deduced from, the identity of the host target genes which VGAM2631 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36774] Nucleotide sequences of the VGAM2631 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2631 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2631 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2631 are further described hereinbelow with reference to Table 1.

[36775] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2631 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36776] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2632 (VGAM2632) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[36777] VGAM2632 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2632 was detected is described hereinabove with reference to Figs. 2-8.

[36778] VGAM2632 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36779] VGAM2632 gene, herein designated VGAM GENE, encodes a VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2632 precursor RNA is designated SEQ ID:2704, and is provided hereinbelow with reference to the sequence listing part.

[36780] VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2632 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36781] An enzyme complex designated DICER COMPLEX, dices the VGAM2632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2632 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2632 RNA is designated SEQ ID:5774, and is provided hereinbelow with reference to the sequence listing part.

[36782] VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2632 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36783] VGAM2632 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2632 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2632 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36784] The complementary binding of VGAM2632 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2632 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2632 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36785] It is appreciated that VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2632 host target genes. The mRNA of each one of this plurality of VGAM2632 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2632 RNA, herein designated VGAM RNA, and which when bound by VGAM2632 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2632 host target proteins.

[36786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2632 gene, herein designated VGAM GENE, on one or more VGAM2632 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36787] It is yet further appreciated that a function of VGAM2632 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2632 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities,

of VGAM2632 correlate with, and may be deduced from, the identity of the host target genes which VGAM2632 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36788] Nucleotide sequences of the VGAM2632 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2632 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2632 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2632 are further described hereinbelow with reference to Table 1.

[36789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2632 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36790] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2633 (VGAM2633) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[36791] VGAM2633 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2633 was detected is described hereinabove with reference to Figs. 2-8.

[36792] VGAM2633 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36793] VGAM2633 gene, herein designated VGAM GENE, encodes a VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2633 precursor RNA is designated SEQ ID:2697, and is provided hereinbelow with reference to the sequence listing part.

[36794] VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36795] An enzyme complex designated DICER COMPLEX, dices the VGAM2633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2633 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2633 RNA is designated SEQ ID:5767, and is provided hereinbelow with reference to the sequence listing part.

[36796] VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36797] VGAM2633 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2633 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2633 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36798] The complementary binding of VGAM2633 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2633 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2633 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36799] It is appreciated that VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2633 host target genes. The mRNA of each one of this plurality of VGAM2633 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2633 RNA, herein designated VGAM RNA, and which when bound by VGAM2633 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2633 host target proteins.

[36800] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2633 gene, herein designated VGAM GENE, on one or more VGAM2633 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36801] It is yet further appreciated that a function of VGAM2633 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2633 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2633 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2633 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36802] Nucleotide sequences of the VGAM2633 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2633 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2633 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2633 are further described hereinbelow with reference to Table 1.

[36803] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2633 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36804] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2634 (VGAM2634) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36805] VGAM2634 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2634 was detected is described hereinabove with reference to Figs. 2-8.

[36806] VGAM2634 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 4. VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36807] VGAM2634 gene, herein designated VGAM GENE, encodes a VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2634 precursor RNA is designated SEQ ID:2698, and is provided hereinbelow with reference to the sequence listing part.

[36808] VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36809] An enzyme complex designated DICER COMPLEX, dices the VGAM2634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2634 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2634 RNA is designated SEQ ID:5768, and is provided hereinbelow with reference to the sequence listing part.

[36810] VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36811] VGAM2634 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2634 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2634 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36812] The complementary binding of VGAM2634 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2634 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2634 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36813] It is appreciated that VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2634 host target genes. The mRNA of each one of this plurality of VGAM2634 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2634 RNA, herein designated VGAM RNA, and which when bound by VGAM2634 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2634 host target proteins.

[36814] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2634 gene, herein designated VGAM GENE, on one or more VGAM2634 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36815] It is yet further appreciated that a function of VGAM2634 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2634 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2634 correlate with, and may be deduced from, the identity of the host target genes which VGAM2634 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[36816] Nucleotide sequences of the VGAM2634 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2634 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2634 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2634 are further described hereinbelow with reference to Table 1.

[36817] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2634 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36818] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2635 (VGAM2635) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36819] VGAM2635 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2635 was detected is described hereinabove with reference to Figs. 2-8.

[36820] VGAM2635 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Red clover mottle virus. VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36821] VGAM2635 gene, herein designated VGAM GENE, encodes a VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2635 precursor RNA is designated SEQ ID:2702, and is provided hereinbelow with reference to the sequence listing part.

[36822] VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36823] An enzyme complex designated DICER COMPLEX, dices the VGAM2635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2635 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2635 RNA is designated SEQ ID:5772, and is provided hereinbelow with reference to the sequence listing part.

[36824] VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36825] VGAM2635 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2635 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2635 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[36826] The complementary binding of VGAM2635 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2635 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2635 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36827] It is appreciated that VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2635 host target genes. The mRNA of each one of this plurality of VGAM2635 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2635 RNA, herein designated VGAM RNA, and which when bound by VGAM2635 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2635 host target proteins.

[36828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2635 gene, herein designated VGAM GENE, on one or more VGAM2635 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36829] It is yet further appreciated that a function of VGAM2635 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2635 include diagnosis, prevention and treatment of viral infection by Red clover mottle virus. Specific functions, and accordingly utilities, of VGAM2635 correlate with, and may be deduced from, the identity of the host target genes which VGAM2635 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[36830] Nucleotide sequences of the VGAM2635 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2635 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2635 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2635 are further described hereinbelow with reference to Table 1.

[36831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2635 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36832] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2636 (VGAM2636) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36833] VGAM2636 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2636 was detected is described hereinabove with reference to Figs. 2-8.

[36834] VGAM2636 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36835] VGAM2636 gene, herein designated VGAM GENE, encodes a VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2636 precursor RNA is designated SEQ ID:2703, and is provided hereinbelow with reference to the sequence listing part.

[36836] VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36837] An enzyme complex designated DICER COMPLEX, dices the VGAM2636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2636 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2636 RNA is designated SEQ ID:5773, and is provided hereinbelow with reference to the sequence listing part.

[36838] VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[36839] VGAM2636 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2636 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2636 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36840] The complementary binding of VGAM2636 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2636 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2636 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36841] It is appreciated that VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2636 host target genes. The mRNA of each one of this plurality of VGAM2636 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2636 RNA, herein designated VGAM RNA, and which when bound by VGAM2636 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2636 host target proteins.

[36842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2636 gene, herein designated VGAM GENE, on one

or more VGAM2636 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36843] It is yet further appreciated that a function of VGAM2636 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2636 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2636 correlate with, and may be deduced from, the identity of the host target genes which VGAM2636 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36844] Nucleotide sequences of the VGAM2636 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2636 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2636 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2636 are further described hereinbelow with reference to Table 1.

[36845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2636 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36846] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2637 (VGAM2637) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36847] VGAM2637 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2637 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[36848] VGAM2637 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine coronavirus. VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36849] VGAM2637 gene, herein designated VGAM GENE, encodes a VGAM2637 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2637 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2637 precursor RNA is designated SEQ ID:2705, and is provided hereinbelow with reference to the sequence listing part.

[36850] VGAM2637 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36851] An enzyme complex designated DICER COMPLEX, dices the VGAM2637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2637 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2637 RNA is designated SEQ ID:5775, and is provided hereinbelow with reference to the sequence listing part.

[36852] VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36853] VGAM2637 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2637 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2637 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36854] The complementary binding of VGAM2637 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2637 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2637 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36855] It is appreciated that VGAM2637 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2637 host target genes. The mRNA of each one of this plurality of VGAM2637 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2637 RNA, herein designated VGAM RNA, and which when bound by VGAM2637 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2637 host target proteins.

[36856] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2637 gene, herein designated VGAM GENE, on one or more VGAM2637 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36857] It is yet further appreciated that a function of VGAM2637 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2637 include diagnosis, prevention and treatment of viral infection by Bovine coronavirus. Specific functions, and accordingly utilities, of VGAM2637 correlate with, and may be deduced from, the identity of the host target genes which VGAM2637 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36858] Nucleotide sequences of the VGAM2637 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2637 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2637 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2637 are further described hereinbelow with reference to Table 1.

[36859] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2637 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36860] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2638 (VGAM2638) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36861] VGAM2638 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2638 was detected is described hereinabove with reference to Figs. 2-8.

[36862] VGAM2638 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aedes albopictus densovirus. VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36863] VGAM2638 gene, herein designated VGAM GENE, encodes a VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2638 precursor RNA is designated SEQ ID:2706, and is provided hereinbelow with reference to the sequence listing part.

[36864] VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[36865] An enzyme complex designated DICER COMPLEX, dices the VGAM2638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2638 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2638 RNA is designated SEQ ID:5776, and is provided hereinbelow with reference to the sequence listing part.

[36866] VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36867] VGAM2638 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2638 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2638 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36868] The complementary binding of VGAM2638 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2638 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2638 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36869] It is appreciated that VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2638 host target genes. The mRNA of each one of this plurality of VGAM2638 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2638 RNA, herein designated VGAM RNA, and which when bound by VGAM2638 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2638 host target proteins.

[36870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2638 gene, herein designated VGAM GENE, on one or more VGAM2638 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36871] It is yet further appreciated that a function of VGAM2638 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2638 include diagnosis, prevention and treatment of viral infection by Aedes albopictus densovirus. Specific functions, and accordingly utilities, of VGAM2638 correlate with, and may be deduced from, the identity of the host target genes which VGAM2638 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36872] Nucleotide sequences of the VGAM2638 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2638 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2638 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2638 are further described hereinbelow with reference to Table 1.

[36873] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2638 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36874] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2639 (VGAM2639) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36875] VGAM2639 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2639 was detected is described hereinabove with reference to Figs. 2-8.

[36876] VGAM2639 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Helminthosporium victoriae virus 190S. VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36877] VGAM2639 gene, herein designated VGAM GENE, encodes a VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2639 precursor RNA is designated SEQ ID:2707, and is provided hereinbelow with reference to the sequence listing part.

[36878] VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36879] An enzyme complex designated DICER COMPLEX, dices the VGAM2639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2639 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2639 RNA is designated SEQ ID:5777, and is provided hereinbelow with reference to the sequence listing part.

[36880] VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36881] VGAM2639 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2639 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2639 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36882] The complementary binding of VGAM2639 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2639 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2639 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2639 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36883] It is appreciated that VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2639 host target genes. The mRNA of each one of this plurality of VGAM2639 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2639 RNA, herein designated VGAM RNA, and which when bound by VGAM2639 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2639 host target proteins.

[36884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2639 gene, herein designated VGAM GENE, on one or more VGAM2639 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36885] It is yet further appreciated that a function of VGAM2639 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2639 include diagnosis, prevention and treatment of viral infection by Helminthosporium victoriae virus 190S. Specific functions, and accordingly utilities, of VGAM2639 correlate with, and may be deduced from, the identity of the host target genes which VGAM2639 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36886] Nucleotide sequences of the VGAM2639 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2639 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2639 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2639 are further described hereinbelow with reference to Table 1.

[36887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2639 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36888] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2640 (VGAM2640) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36889] VGAM2640 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2640 was detected is described hereinabove with reference to Figs. 2-8.

[36890] VGAM2640 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei ento-

mopoxvirus. VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36891] VGAM2640 gene, herein designated VGAM GENE, encodes a VGAM2640 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2640 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2640 precursor RNA is designated SEQ ID:2708, and is provided hereinbelow with reference to the sequence listing part.

[36892] VGAM2640 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36893] An enzyme complex designated DICER COMPLEX, dices

the VGAM2640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2640 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2640 RNA is designated SEQ ID:5778, and is provided hereinbelow with reference to the sequence listing part.

[36894] VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36895] VGAM2640 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2640 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2640 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2640 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36896] The complementary binding of VGAM2640 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2640 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2640 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36897] It is appreciated that VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2640 host target genes. The mRNA of each one of this plurality of VGAM2640 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2640 RNA, herein designated VGAM RNA, and which when bound by VGAM2640 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2640 host target proteins.

[36898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2640 gene, herein designated VGAM GENE, on one or more VGAM2640 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36899] It is yet further appreciated that a function of VGAM2640 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2640 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2640 correlate with, and may be deduced from, the identity of the host target genes which VGAM2640 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36900] Nucleotide sequences of the VGAM2640 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2640 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2640 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2640 are further described hereinbelow with reference to Table 1.

[36901] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2640 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36902] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2641 (VGAM2641) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36903] VGAM2641 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2641 was detected is described hereinabove with reference to Figs. 2-8.

[36904] VGAM2641 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM2641 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[36905] VGAM2641 gene, herein designated VGAM GENE, encodes a VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2641 precursor RNA is designated SEQ ID:2714, and is provided hereinbelow with reference to the sequence listing part.

[36906] VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2641 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36907] An enzyme complex designated DICER COMPLEX, dices the VGAM2641 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2641 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2641 RNA is designated SEQ ID:5784, and is provided hereinbelow with reference to the sequence listing part.

[36908] VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36909] VGAM2641 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2641 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2641 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36910] The complementary binding of VGAM2641 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2641 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2641

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2641 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36911] It is appreciated that VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2641 host target genes. The mRNA of each one of this plurality of VGAM2641 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2641 RNA, herein designated VGAM RNA, and which when bound by VGAM2641 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2641 host target proteins.

[36912] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2641 gene, herein designated VGAM GENE, on one or more VGAM2641 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36913] It is yet further appreciated that a function of VGAM2641 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2641 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2641 correlate with, and may be deduced from, the identity of the host target genes which VGAM2641 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36914] Nucleotide sequences of the VGAM2641 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2641 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2641 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2641 are further described hereinbelow with reference to Table 1.

[36915] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2641 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36916] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2642 (VGAM2642) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36917] VGAM2642 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2642 was detected is described hereinabove with reference to Figs. 2-8.

[36918] VGAM2642 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[36919] VGAM2642 gene, herein designated VGAM GENE, encodes a VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2642 precursor RNA is designated SEQ ID:2710, and is provided hereinbelow with reference to the sequence listing part.

[36920] VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36921] An enzyme complex designated DICER COMPLEX, dices the VGAM2642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2642 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2642 RNA is designated SEQ ID:5780, and is provided hereinbelow with reference to the sequence listing part.

[36922] VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36923] VGAM2642 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2642 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2642 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36924] The complementary binding of VGAM2642 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2642 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2642 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2642 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36925] It is appreciated that VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2642 host target genes. The mRNA of each one of this plurality of VGAM2642 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2642 RNA, herein designated VGAM RNA, and which when bound by VGAM2642 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2642 host target proteins.

[36926] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2642 gene, herein designated VGAM GENE, on one or more VGAM2642 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36927] It is yet further appreciated that a function of VGAM2642 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2642 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2642 correlate with, and may be deduced from, the identity of the host target genes which VGAM2642 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36928] Nucleotide sequences of the VGAM2642 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2642 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2642 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2642 are further

described hereinbelow with reference to Table 1.

[36929] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2642 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36930] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2643 (VGAM2643) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36931] VGAM2643 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2643 was detected is described hereinabove with reference to Figs. 2-8.

[36932] VGAM2643 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 12. VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36933] VGAM2643 gene, herein designated VGAM GENE, encodes a VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2643 precursor RNA is designated SEQ ID:2717, and is provided hereinbelow with reference to the sequence listing part.

[36934] VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36935] An enzyme complex designated DICER COMPLEX, dices the VGAM2643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2643 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2643 RNA is designated SEQ ID:5787, and is provided hereinbelow with reference to the sequence listing part.

[36936] VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36937] VGAM2643 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2643 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2643 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36938] The complementary binding of VGAM2643 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2643 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2643 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36939] It is appreciated that VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2643 host target genes. The mRNA of each one of this plurality of VGAM2643 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2643 RNA, herein designated VGAM RNA, and which when bound by VGAM2643 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2643 host target proteins.

[36940] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2643 gene, herein designated VGAM GENE, on one or more VGAM2643 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36941] It is yet further appreciated that a function of VGAM2643 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2643 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 12. Specific functions, and accordingly utilities, of VGAM2643 correlate with, and may be deduced from, the identity of the host target genes which VGAM2643 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36942] Nucleotide sequences of the VGAM2643 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2643 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2643 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2643 are further described hereinbelow with reference to Table 1.

[36943] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2643 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36944] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2644 (VGAM2644) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36945] VGAM2644 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2644 was detected is described hereinabove with reference to Figs. 2-8.

[36946] VGAM2644 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 13. VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36947] VGAM2644 gene, herein designated VGAM GENE, encodes

a VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2644 precursor RNA is designated SEQ ID:2711, and is provided hereinbelow with reference to the sequence listing part.

[36948] VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36949] An enzyme complex designated DICER COMPLEX, dices the VGAM2644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2644 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2644 RNA is designated SEQ ID:5781, and is provided hereinbelow with reference to the sequence listing part.

[36950] VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36951] VGAM2644 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2644 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2644 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36952] The complementary binding of VGAM2644 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2644 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2644 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[36953] It is appreciated that VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2644 host target genes. The mRNA of each one of this plurality of VGAM2644 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2644 RNA, herein designated VGAM RNA, and which when bound by VGAM2644 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2644 host target proteins.

[36954] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2644 gene, herein designated VGAM GENE, on one or more VGAM2644 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36955] It is yet further appreciated that a function of VGAM2644 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2644 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 13. Specific functions, and accordingly utilities, of VGAM2644 correlate with, and may be deduced from, the identity of the host target genes which VGAM2644 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36956] Nucleotide sequences of the VGAM2644 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2644 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2644 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2644 are further described hereinbelow with reference to Table 1.

[36957] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2644 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36958] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2645 (VGAM2645) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36959] VGAM2645 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2645 was detected is described hereinabove with reference to Figs. 2-8.

[36960] VGAM2645 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36961] VGAM2645 gene, herein designated VGAM GENE, encodes a VGAM2645 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2645 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2645 precursor RNA is designated SEQ ID:2712, and is provided hereinbelow with reference to the sequence listing part.

[36962] VGAM2645 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36963] An enzyme complex designated DICER COMPLEX, dices the VGAM2645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2645 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2645 RNA is designated SEQ ID:5782, and is provided hereinbelow with reference to the sequence listing part.

[36964] VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36965] VGAM2645 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2645 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2645 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36966] The complementary binding of VGAM2645 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2645 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2645 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36967] It is appreciated that VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2645 host target genes. The mRNA of each one of this plurality of VGAM2645 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2645 RNA, herein designated VGAM RNA, and which when bound by VGAM2645 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2645 host target proteins.

[36968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2645 gene, herein designated VGAM GENE, on one or more VGAM2645 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36969] It is yet further appreciated that a function of VGAM2645 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2645 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM2645 correlate with, and may be deduced from, the identity of the host target genes which VGAM2645 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36970] Nucleotide sequences of the VGAM2645 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2645 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2645 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2645 are further described hereinbelow with reference to Table 1.

[36971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2645 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36972] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2646 (VGAM2646) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36973] VGAM2646 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2646 was detected is described hereinabove with reference to Figs. 2-8.

[36974] VGAM2646 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36975] VGAM2646 gene, herein designated VGAM GENE, encodes a VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2646 precursor RNA is designated SEQ ID:2713, and is provided hereinbelow with reference to the sequence listing part.

[36976] VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36977] An enzyme complex designated DICER COMPLEX, dices the VGAM2646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2646 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2646 RNA is designated SEQ ID:5783, and is provided hereinbelow with reference to the sequence listing part.

[36978] VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36979] VGAM2646 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2646 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2646 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36980] The complementary binding of VGAM2646 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2646 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2646 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36981] It is appreciated that VGAM2646 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2646 host target genes. The mRNA of each one of this plurality of VGAM2646 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2646 RNA, herein designated VGAM RNA, and which when bound by VGAM2646 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2646 host target proteins.

[36982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2646 gene, herein designated VGAM GENE, on one or more VGAM2646 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36983] It is yet further appreciated that a function of VGAM2646 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2646 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM2646 correlate with, and may be deduced from, the identity of the host target genes which VGAM2646 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36984] Nucleotide sequences of the VGAM2646 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2646 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2646 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2646 are further described hereinbelow with reference to Table 1.

[36985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2646 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[36986] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2647 (VGAM2647) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[36987] VGAM2647 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2647 was detected is described hereinabove with reference to Figs. 2-8.

[36988] VGAM2647 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[36989] VGAM2647 gene, herein designated VGAM GENE, encodes a VGAM2647 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2647 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2647 precursor RNA is designated SEQ ID:1824, and is provided hereinbelow with reference to the sequence listing part.

[36990] VGAM2647 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[36991] An enzyme complex designated DICER COMPLEX, dices the VGAM2647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2647 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2647 RNA is designated SEQ ID:4894, and is provided hereinbelow with reference to the sequence listing part.

[36992] VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[36993] VGAM2647 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2647 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2647 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[36994] The complementary binding of VGAM2647 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2647 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2647 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[36995] It is appreciated that VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2647 host target genes. The mRNA of each one of this plurality of VGAM2647 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2647 RNA, herein designated VGAM RNA, and which when bound by VGAM2647 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2647 host target proteins.

[36996] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2647 gene, herein designated VGAM GENE, on one or more VGAM2647 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[36997] It is yet further appreciated that a function of VGAM2647 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2647 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2647 correlate with, and may be deduced from, the identity of the host target genes which VGAM2647 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[36998] Nucleotide sequences of the VGAM2647 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2647 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2647 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2647 are further described hereinbelow with reference to Table 1.

[36999] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2647 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37000] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2648 (VGAM2648) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37001] VGAM2648 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2648 was detected is described hereinabove with reference to Figs. 2-8.

[37002] VGAM2648 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37003] VGAM2648 gene, herein designated VGAM GENE, encodes a VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2648 precursor RNA is designated SEQ ID:1832, and is provided hereinbelow with reference to the sequence listing part.

[37004] VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37005] An enzyme complex designated DICER COMPLEX, dices the VGAM2648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2648 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2648 RNA is designated SEQ ID:4902, and is provided hereinbelow with reference to the sequence listing part.

[37006] VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37007] VGAM2648 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2648 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2648 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37008] The complementary binding of VGAM2648 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2648 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2648 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37009] It is appreciated that VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2648 host target genes. The mRNA of

each one of this plurality of VGAM2648 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2648 RNA, herein designated VGAM RNA, and which when bound by VGAM2648 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2648 host target proteins.

[37010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2648 gene, herein designated VGAM GENE, on one or more VGAM2648 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[37011] It is yet further appreciated that a function of VGAM2648 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2648 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2648 correlate with, and may be deduced from, the identity of the host target genes which VGAM2648 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37012] Nucleotide sequences of the VGAM2648 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2648 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2648 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2648 are further described hereinbelow with reference to Table 1.

[37013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2648 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[37014] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2649 (VGAM2649) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37015] VGAM2649 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2649 was detected is described hereinabove with reference to Figs. 2-8.

[37016] VGAM2649 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37017] VGAM2649 gene, herein designated VGAM GENE, encodes a VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2649 precursor RNA is designated SEQ ID:1825, and is provided hereinbelow with reference to the sequence listing part.

[37018] VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37019] An enzyme complex designated DICER COMPLEX, dices the VGAM2649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2649 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2649 RNA is designated SEQ ID:4895, and

is provided hereinbelow with reference to the sequence listing part.

[37020] VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37021] VGAM2649 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2649 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2649 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37022] The complementary binding of VGAM2649 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2649 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2649 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37023] It is appreciated that VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2649 host target genes. The mRNA of each one of this plurality of VGAM2649 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2649 RNA, herein designated VGAM RNA, and which when bound by VGAM2649 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2649 host target proteins.

[37024] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2649 gene, herein designated VGAM GENE, on one or more VGAM2649 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37025] It is yet further appreciated that a function of VGAM2649 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2649 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2649 correlate with, and may be deduced from, the identity of the host target genes which VGAM2649 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37026] Nucleotide sequences of the VGAM2649 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2649 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2649 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2649 are further described hereinbelow with reference to Table 1.

[37027] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2649 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37028] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2650 (VGAM2650) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37029] VGAM2650 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2650 was detected is described hereinabove with reference to Figs. 2-8.

[37030] VGAM2650 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37031] VGAM2650 gene, herein designated VGAM GENE, encodes a VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2650 precur-

sor RNA is designated SEQ ID:2715, and is provided hereinbelow with reference to the sequence listing part.

[37032] VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37033] An enzyme complex designated DICER COMPLEX, dices the VGAM2650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2650 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2650 RNA is designated SEQ ID:5785, and is provided hereinbelow with reference to the sequence

listing part.

[37034] VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37035] VGAM2650 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2650 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2650 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37036] The complementary binding of VGAM2650 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2650 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2650 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37037] It is appreciated that VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2650 host target genes. The mRNA of each one of this plurality of VGAM2650 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2650 RNA, herein designated VGAM RNA, and which when bound by VGAM2650 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2650 host target proteins.

[37038] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2650 gene, herein designated VGAM GENE, on one or more VGAM2650 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37039] It is yet further appreciated that a function of VGAM2650

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2650 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2650 correlate with, and may be deduced from, the identity of the host target genes which VGAM2650 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37040] Nucleotide sequences of the VGAM2650 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2650 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2650 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2650 are further described hereinbelow with reference to Table 1.

[37041] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2650 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37042] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2651 (VGAM2651) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37043] VGAM2651 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2651 was detected is described hereinabove with reference to Figs. 2-8.

[37044] VGAM2651 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine adenovirus A. VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37045] VGAM2651 gene, herein designated VGAM GENE, encodes a VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2651 precursor RNA is designated SEQ ID:2716, and is provided here-

inbelow with reference to the sequence listing part.

[37046] VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37047] An enzyme complex designated DICER COMPLEX, dices the VGAM2651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2651 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2651 RNA is designated SEQ ID:5786, and is provided hereinbelow with reference to the sequence listing part.

[37048] VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37049] VGAM2651 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2651 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2651 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37050] The complementary binding of VGAM2651 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2651 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2651 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37051] It is appreciated that VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2651 host target genes. The mRNA of each one of this plurality of VGAM2651 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2651 RNA, herein designated VGAM RNA, and which when bound by VGAM2651 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2651 host target proteins.

[37052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2651 gene, herein designated VGAM GENE, on one or more VGAM2651 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37053] It is yet further appreciated that a function of VGAM2651 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2651 include diagnosis, prevention and treatment of viral infection by Murine adenovirus A. Specific functions, and accordingly utilities, of VGAM2651 correlate with, and may be deduced from, the identity of the host target genes which VGAM2651 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37054] Nucleotide sequences of the VGAM2651 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2651 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2651 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2651 are further described hereinbelow with reference to Table 1.

[37055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2651 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37056] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2652 (VGAM2652) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37057] VGAM2652 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2652 was detected is described hereinabove with reference to Figs. 2-8.

[37058] VGAM2652 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37059] VGAM2652 gene, herein designated VGAM GENE, encodes a VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2652 precursor RNA is designated SEQ ID:1840, and is provided hereinbelow with reference to the sequence listing part.

[37060] VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37061] An enzyme complex designated DICER COMPLEX, dices the VGAM2652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2652 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2652 RNA is designated SEQ ID:4910, and is provided hereinbelow with reference to the sequence listing part.

[37062] VGAM2652 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37063] VGAM2652 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2652 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2652 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37064] The complementary binding of VGAM2652 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2652 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2652 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37065] It is appreciated that VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2652 host target genes. The mRNA of each one of this plurality of VGAM2652 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2652 RNA, herein designated VGAM

RNA, and which when bound by VGAM2652 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2652 host target proteins.

[37066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2652 gene, herein designated VGAM GENE, on one or more VGAM2652 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37067] It is yet further appreciated that a function of VGAM2652 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2652 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2652 correlate with, and may be deduced from, the identity of the host target genes which VGAM2652 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37068] Nucleotide sequences of the VGAM2652 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2652 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2652 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2652 are further described hereinbelow with reference to Table 1.

[37069] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2652 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37070] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2653 (VGAM2653) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37071] VGAM2653 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2653 was detected is described hereinabove with reference to Figs. 2-8.

[37072] VGAM2653 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37073] VGAM2653 gene, herein designated VGAM GENE, encodes a VGAM2653 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2653 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2653 precursor RNA is designated SEQ ID:1833, and is provided hereinbelow with reference to the sequence listing part.

[37074] VGAM2653 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37075] An enzyme complex designated DICER COMPLEX, dices the VGAM2653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2653 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2653 RNA is designated SEQ ID:4903, and is provided hereinbelow with reference to the sequence listing part.

[37076] VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37077] VGAM2653 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2653 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2653 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2653 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37078] The complementary binding of VGAM2653 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2653 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2653 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37079] It is appreciated that VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2653 host target genes. The mRNA of each one of this plurality of VGAM2653 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2653 RNA, herein designated VGAM RNA, and which when bound by VGAM2653 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2653 host target proteins.

[37080] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2653 gene, herein designated VGAM GENE, on one or more VGAM2653 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37081] It is yet further appreciated that a function of VGAM2653 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2653 include diagnosis, prevention and

treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2653 correlate with, and may be deduced from, the identity of the host target genes which VGAM2653 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37082] Nucleotide sequences of the VGAM2653 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2653 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2653 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2653 are further described hereinbelow with reference to Table 1.

[37083] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2653 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37084] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2654 (VGAM2654) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37085] VGAM2654 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2654 was detected is described hereinabove with reference to Figs. 2-8.

[37086] VGAM2654 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37087] VGAM2654 gene, herein designated VGAM GENE, encodes a VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2654 precursor RNA is designated SEQ ID:2718, and is provided hereinbelow with reference to the sequence listing part.

[37088] VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2654 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37089] An enzyme complex designated DICER COMPLEX, dices the VGAM2654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2654 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2654 RNA is designated SEQ ID:5788, and is provided hereinbelow with reference to the sequence listing part.

[37090] VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2654 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37091] VGAM2654 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2654 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2654 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37092] The complementary binding of VGAM2654 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2654 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2654 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37093] It is appreciated that VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2654 host target genes. The mRNA of each one of this plurality of VGAM2654 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2654 RNA, herein designated VGAM RNA, and which when bound by VGAM2654 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2654 host target proteins.

[37094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2654 gene, herein designated VGAM GENE, on one or more VGAM2654 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37095] It is yet further appreciated that a function of VGAM2654 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2654 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria

Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2654 correlate with, and may be deduced from, the identity of the host target genes which VGAM2654 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37096] Nucleotide sequences of the VGAM2654 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2654 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2654 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2654 are further described hereinbelow with reference to Table 1.

[37097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2654 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37098] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2655 (VGAM2655) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[37099] VGAM2655 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2655 was detected is described hereinabove with reference to Figs. 2-8.

[37100] VGAM2655 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Common chimpanzee papillomavirus 1. VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37101] VGAM2655 gene, herein designated VGAM GENE, encodes a VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2655 precursor RNA is designated SEQ ID:2719, and is provided hereinbelow with reference to the sequence listing part.

[37102] VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2655 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37103] An enzyme complex designated DICER COMPLEX, dices the VGAM2655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2655 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2655 RNA is designated SEQ ID:5789, and is provided hereinbelow with reference to the sequence listing part.

[37104] VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2655 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37105] VGAM2655 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2655 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2655 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37106] The complementary binding of VGAM2655 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2655 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2655 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37107] It is appreciated that VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2655 host target genes. The mRNA of each one of this plurality of VGAM2655 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2655 RNA, herein designated VGAM RNA, and which when bound by VGAM2655 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2655 host target proteins.

[37108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2655 gene, herein designated VGAM GENE, on one or more VGAM2655 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37109] It is yet further appreciated that a function of VGAM2655 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2655 include diagnosis, prevention and treatment of viral infection by Common chimpanzee papillomavirus 1. Specific functions, and accordingly utili-

ties, of VGAM2655 correlate with, and may be deduced from, the identity of the host target genes which VGAM2655 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37110] Nucleotide sequences of the VGAM2655 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2655 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2655 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2655 are further described hereinbelow with reference to Table 1.

[37111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2655 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37112] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2656 (VGAM2656) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[37113] VGAM2656 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2656 was detected is described hereinabove with reference to Figs. 2-8.

[37114] VGAM2656 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 14. VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37115] VGAM2656 gene, herein designated VGAM GENE, encodes a VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2656 precursor RNA is designated SEQ ID:2720, and is provided hereinbelow with reference to the sequence listing part.

[37116] VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37117] An enzyme complex designated DICER COMPLEX, dices the VGAM2656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2656 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2656 RNA is designated SEQ ID:5790, and is provided hereinbelow with reference to the sequence listing part.

[37118] VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37119] VGAM2656 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2656 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2656 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37120] The complementary binding of VGAM2656 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2656 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2656 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37121] It is appreciated that VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2656 host target genes. The mRNA of each one of this plurality of VGAM2656 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2656 RNA, herein designated VGAM RNA, and which when bound by VGAM2656 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2656 host target proteins.

[37122] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2656 gene, herein designated VGAM GENE, on one or more VGAM2656 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37123] It is yet further appreciated that a function of VGAM2656 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2656 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 14. Specific functions, and accordingly utilities, of VGAM2656 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2656 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37124] Nucleotide sequences of the VGAM2656 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2656 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2656 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2656 are further described hereinbelow with reference to Table 1.

[37125] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2656 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37126] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2657 (VGAM2657) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37127] VGAM2657 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2657 was detected is described hereinabove with reference to Figs. 2-8.

[37128] VGAM2657 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37129] VGAM2657 gene, herein designated VGAM GENE, encodes a VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2657 precursor RNA is designated SEQ ID:1826, and is provided hereinbelow with reference to the sequence listing part.

[37130] VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37131] An enzyme complex designated DICER COMPLEX, dices the VGAM2657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2657 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2657 RNA is designated SEQ ID:4896, and is provided hereinbelow with reference to the sequence listing part.

[37132] VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37133] VGAM2657 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2657 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2657 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37134] The complementary binding of VGAM2657 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2657 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2657 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37135] It is appreciated that VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2657 host target genes. The mRNA of each one of this plurality of VGAM2657 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2657 RNA, herein designated VGAM RNA, and which when bound by VGAM2657 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2657 host target proteins.

[37136] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2657 gene, herein designated VGAM GENE, on one or more VGAM2657 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37137] It is yet further appreciated that a function of VGAM2657 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2657 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2657 correlate with, and may be deduced from, the identity of the host target genes which VGAM2657 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[37138] Nucleotide sequences of the VGAM2657 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2657 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2657 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2657 are further described hereinbelow with reference to Table 1.

[37139] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2657 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37140] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2658 (VGAM2658) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37141] VGAM2658 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2658 was detected is described hereinabove with reference to Figs. 2-8.

[37142] VGAM2658 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 47. VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37143] VGAM2658 gene, herein designated VGAM GENE, encodes a VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2658 precursor RNA is designated SEQ ID:2721, and is provided hereinbelow with reference to the sequence listing part.

[37144] VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37145] An enzyme complex designated DICER COMPLEX, dices the VGAM2658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2658 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2658 RNA is designated SEQ ID:5791, and is provided hereinbelow with reference to the sequence listing part.

[37146] VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37147] VGAM2658 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2658 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2658 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[37148] The complementary binding of VGAM2658 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2658 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2658 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37149] It is appreciated that VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2658 host target genes. The mRNA of each one of this plurality of VGAM2658 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2658 RNA, herein designated VGAM RNA, and which when bound by VGAM2658 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2658 host target proteins.

[37150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2658 gene, herein designated VGAM GENE, on one or more VGAM2658 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37151] It is yet further appreciated that a function of VGAM2658 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2658 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 47. Specific functions, and accordingly utilities, of VGAM2658 correlate with, and may be deduced from, the identity of the host target genes which VGAM2658 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[37152] Nucleotide sequences of the VGAM2658 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2658 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2658 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2658 are further described hereinbelow with reference to Table 1.

[37153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2658 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37154] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2659 (VGAM2659) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37155] VGAM2659 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2659 was detected is described hereinabove with reference to Figs. 2-8.

[37156] VGAM2659 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37157] VGAM2659 gene, herein designated VGAM GENE, encodes a VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2659 precursor RNA is designated SEQ ID:2722, and is provided hereinbelow with reference to the sequence listing part.

[37158] VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37159] An enzyme complex designated DICER COMPLEX, dices the VGAM2659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2659 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2659 RNA is designated SEQ ID:5792, and is provided hereinbelow with reference to the sequence listing part.

[37160] VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[37161] VGAM2659 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2659 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2659 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37162] The complementary binding of VGAM2659 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2659 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2659 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37163] It is appreciated that VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2659 host target genes. The mRNA of each one of this plurality of VGAM2659 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2659 RNA, herein designated VGAM RNA, and which when bound by VGAM2659 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2659 host target proteins.

[37164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2659 gene, herein designated VGAM GENE, on one

or more VGAM2659 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37165] It is yet further appreciated that a function of VGAM2659 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2659 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2659 correlate with, and may be deduced from, the identity of the host target genes which VGAM2659 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37166] Nucleotide sequences of the VGAM2659 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2659 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2659 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2659 are further described hereinbelow with reference to Table 1.

[37167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2659 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37168] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2660 (VGAM2660) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37169] VGAM2660 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2660 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[37170] VGAM2660 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37171] VGAM2660 gene, herein designated VGAM GENE, encodes a VGAM2660 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2660 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2660 precursor RNA is designated SEQ ID:2723, and is provided hereinbelow with reference to the sequence listing part.

[37172] VGAM2660 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37173] An enzyme complex designated DICER COMPLEX, dices the VGAM2660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2660 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2660 RNA is designated SEQ ID:5793, and is provided hereinbelow with reference to the sequence listing part.

[37174] VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37175] VGAM2660 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2660 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2660 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37176] The complementary binding of VGAM2660 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2660 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2660 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37177] It is appreciated that VGAM2660 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2660 host target genes. The mRNA of each one of this plurality of VGAM2660 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2660 RNA, herein designated VGAM RNA, and which when bound by VGAM2660 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2660 host target proteins.

[37178] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2660 gene, herein designated VGAM GENE, on one or more VGAM2660 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37179] It is yet further appreciated that a function of VGAM2660 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2660 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2660 correlate with, and may be deduced from, the identity of the host target genes which VGAM2660 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37180] Nucleotide sequences of the VGAM2660 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2660 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2660 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2660 are further described hereinbelow with reference to Table 1.

[37181] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2660 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37182] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2661 (VGAM2661) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37183] VGAM2661 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2661 was detected is described hereinabove with reference to Figs. 2-8.

[37184] VGAM2661 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Transmissible gastroenteritis virus. VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37185] VGAM2661 gene, herein designated VGAM GENE, encodes a VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2661 precursor RNA is designated SEQ ID:1846, and is provided hereinbelow with reference to the sequence listing part.

[37186] VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[37187] An enzyme complex designated DICER COMPLEX, dices the VGAM2661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2661 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2661 RNA is designated SEQ ID:4916, and is provided hereinbelow with reference to the sequence listing part.

[37188] VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37189] VGAM2661 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2661 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2661 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37190] The complementary binding of VGAM2661 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2661 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2661 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37191] It is appreciated that VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2661 host target genes. The mRNA of each one of this plurality of VGAM2661 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2661 RNA, herein designated VGAM RNA, and which when bound by VGAM2661 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2661 host target proteins.

[37192] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2661 gene, herein designated VGAM GENE, on one or more VGAM2661 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37193] It is yet further appreciated that a function of VGAM2661 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2661 include diagnosis, prevention and treatment of viral infection by Transmissible gastroenteritis virus. Specific functions, and accordingly utilities, of VGAM2661 correlate with, and may be deduced from, the identity of the host target genes which VGAM2661 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37194] Nucleotide sequences of the VGAM2661 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2661 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2661 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2661 are further described hereinbelow with reference to Table 1.

[37195] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2661 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37196] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2662 (VGAM2662) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37197] VGAM2662 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2662 was detected is described hereinabove with reference to Figs. 2-8.

[37198] VGAM2662 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia virus. VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37199] VGAM2662 gene, herein designated VGAM GENE, encodes a VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2662 precursor RNA is designated SEQ ID:1827, and is provided hereinbelow with reference to the sequence listing part.

[37200] VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37201] An enzyme complex designated DICER COMPLEX, dices the VGAM2662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2662 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2662 RNA is designated SEQ ID:4897, and is provided hereinbelow with reference to the sequence listing part.

[37202] VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37203] VGAM2662 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2662 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2662 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37204] The complementary binding of VGAM2662 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2662 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2662 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2662 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37205] It is appreciated that VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2662 host target genes. The mRNA of each one of this plurality of VGAM2662 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2662 RNA, herein designated VGAM RNA, and which when bound by VGAM2662 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2662 host target proteins.

[37206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2662 gene, herein designated VGAM GENE, on one or more VGAM2662 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37207] It is yet further appreciated that a function of VGAM2662 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2662 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2662 correlate with, and may be deduced from, the identity of the host target genes which VGAM2662 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37208] Nucleotide sequences of the VGAM2662 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2662 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2662 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2662 are further described hereinbelow with reference to Table 1.

[37209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2662 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37210] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2663 (VGAM2663) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37211] VGAM2663 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2663 was detected is described hereinabove with reference to Figs. 2-8.

[37212] VGAM2663 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine her-

pesvirus 7. VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37213] VGAM2663 gene, herein designated VGAM GENE, encodes a VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2663 precursor RNA is designated SEQ ID:1834, and is provided hereinbelow with reference to the sequence listing part.

[37214] VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37215] An enzyme complex designated DICER COMPLEX, dices

the VGAM2663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2663 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2663 RNA is designated SEQ ID:4904, and is provided hereinbelow with reference to the sequence listing part.

[37216] VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37217] VGAM2663 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2663 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2663 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2663 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37218] The complementary binding of VGAM2663 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2663 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2663 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37219] It is appreciated that VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2663 host target genes. The mRNA of each one of this plurality of VGAM2663 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2663 RNA, herein designated VGAM RNA, and which when bound by VGAM2663 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2663 host target proteins.

[37220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2663 gene, herein designated VGAM GENE, on one or more VGAM2663 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37221] It is yet further appreciated that a function of VGAM2663 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2663 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2663 correlate with, and may be deduced from, the identity of the host target genes which VGAM2663 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37222] Nucleotide sequences of the VGAM2663 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2663 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2663 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2663 are further described hereinbelow with reference to Table 1.

[37223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2663 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37224] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2664 (VGAM2664) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37225] VGAM2664 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2664 was detected is described hereinabove with reference to Figs. 2-8.

[37226] VGAM2664 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2664 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[37227] VGAM2664 gene, herein designated VGAM GENE, encodes a VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2664 precursor RNA is designated SEQ ID:1828, and is provided hereinbelow with reference to the sequence listing part.

[37228] VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2664 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37229] An enzyme complex designated DICER COMPLEX, dices the VGAM2664 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2664 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2664 RNA is designated SEQ ID:4898, and is provided hereinbelow with reference to the sequence listing part.

[37230] VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37231] VGAM2664 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2664 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2664 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37232] The complementary binding of VGAM2664 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2664 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2664

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2664 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37233] It is appreciated that VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2664 host target genes. The mRNA of each one of this plurality of VGAM2664 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2664 RNA, herein designated VGAM RNA, and which when bound by VGAM2664 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2664 host target proteins.

[37234] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2664 gene, herein designated VGAM GENE, on one or more VGAM2664 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37235] It is yet further appreciated that a function of VGAM2664 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2664 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2664 correlate with, and may be deduced from, the identity of the host target genes which VGAM2664 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37236] Nucleotide sequences of the VGAM2664 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2664 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2664 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2664 are further described hereinbelow with reference to Table 1.

[37237] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2664 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37238] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2665 (VGAM2665) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37239] VGAM2665 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2665 was detected is described hereinabove with reference to Figs. 2-8.

[37240] VGAM2665 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[37241] VGAM2665 gene, herein designated VGAM GENE, encodes a VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2665 precursor RNA is designated SEQ ID:1829, and is provided hereinbelow with reference to the sequence listing part.

[37242] VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37243] An enzyme complex designated DICER COMPLEX, dices the VGAM2665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2665 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2665 RNA is designated SEQ ID:4899, and is provided hereinbelow with reference to the sequence listing part.

[37244] VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37245] VGAM2665 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2665 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2665 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37246] The complementary binding of VGAM2665 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2665 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2665 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2665 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37247] It is appreciated that VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2665 host target genes. The mRNA of each one of this plurality of VGAM2665 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2665 RNA, herein designated VGAM RNA, and which when bound by VGAM2665 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2665 host target proteins.

[37248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2665 gene, herein designated VGAM GENE, on one or more VGAM2665 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37249] It is yet further appreciated that a function of VGAM2665 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2665 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2665 correlate with, and may be deduced from, the identity of the host target genes which VGAM2665 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37250] Nucleotide sequences of the VGAM2665 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2665 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2665 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2665 are further

described hereinbelow with reference to Table 1.

[37251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2665 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37252] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2666 (VGAM2666) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37253] VGAM2666 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2666 was detected is described hereinabove with reference to Figs. 2-8.

[37254] VGAM2666 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 90. VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37255] VGAM2666 gene, herein designated VGAM GENE, encodes a VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2666 precursor RNA is designated SEQ ID:1830, and is provided hereinbelow with reference to the sequence listing part.

[37256] VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37257] An enzyme complex designated DICER COMPLEX, dices the VGAM2666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2666 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2666 RNA is designated SEQ ID:4900, and is provided hereinbelow with reference to the sequence listing part.

[37258] VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37259] VGAM2666 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2666 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2666 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37260] The complementary binding of VGAM2666 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2666 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2666 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37261] It is appreciated that VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2666 host target genes. The mRNA of each one of this plurality of VGAM2666 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2666 RNA, herein designated VGAM RNA, and which when bound by VGAM2666 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2666 host target proteins.

[37262] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2666 gene, herein designated VGAM GENE, on one or more VGAM2666 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37263] It is yet further appreciated that a function of VGAM2666 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2666 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 90. Specific functions, and accordingly utilities, of VGAM2666 correlate with, and may be deduced from, the identity of the host target genes which VGAM2666 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37264] Nucleotide sequences of the VGAM2666 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2666 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2666 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2666 are further described hereinbelow with reference to Table 1.

[37265] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2666 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37266] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2667 (VGAM2667) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37267] VGAM2667 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2667 was detected is described hereinabove with reference to Figs. 2-8.

[37268] VGAM2667 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37269] VGAM2667 gene, herein designated VGAM GENE, encodes

a VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2667 precursor RNA is designated SEQ ID:1831, and is provided hereinbelow with reference to the sequence listing part.

[37270] VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37271] An enzyme complex designated DICER COMPLEX, dices the VGAM2667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2667 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2667 RNA is designated SEQ ID:4901, and is provided hereinbelow with reference to the sequence listing part.

[37272] VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37273] VGAM2667 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2667 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2667 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37274] The complementary binding of VGAM2667 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2667 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2667 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[37275] It is appreciated that VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2667 host target genes. The mRNA of each one of this plurality of VGAM2667 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2667 RNA, herein designated VGAM RNA, and which when bound by VGAM2667 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2667 host target proteins.

[37276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2667 gene, herein designated VGAM GENE, on one or more VGAM2667 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37277] It is yet further appreciated that a function of VGAM2667 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2667 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM2667 correlate with, and may be deduced from, the identity of the host target genes which VGAM2667 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37278] Nucleotide sequences of the VGAM2667 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2667 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2667 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2667 are further described hereinbelow with reference to Table 1.

[37279] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2667 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37280] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2668 (VGAM2668) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37281] VGAM2668 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2668 was detected is described hereinabove with reference to Figs. 2-8.

[37282] VGAM2668 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37283] VGAM2668 gene, herein designated VGAM GENE, encodes a VGAM2668 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2668 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2668 precursor RNA is designated SEQ ID:1835, and is provided hereinbelow with reference to the sequence listing part.

[37284] VGAM2668 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37285] An enzyme complex designated DICER COMPLEX, dices the VGAM2668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2668 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2668 RNA is designated SEQ ID:4905, and is provided hereinbelow with reference to the sequence listing part.

[37286] VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37287] VGAM2668 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2668 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2668 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37288] The complementary binding of VGAM2668 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2668 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2668 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37289] It is appreciated that VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2668 host target genes. The mRNA of each one of this plurality of VGAM2668 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2668 RNA, herein designated VGAM RNA, and which when bound by VGAM2668 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2668 host target proteins.

[37290] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2668 gene, herein designated VGAM GENE, on one or more VGAM2668 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37291] It is yet further appreciated that a function of VGAM2668 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2668 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2668 correlate with, and may be deduced from, the identity of the host target genes which VGAM2668 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37292] Nucleotide sequences of the VGAM2668 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2668 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2668 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2668 are further described hereinbelow with reference to Table 1.

[37293] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2668 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37294] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2669 (VGAM2669) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37295] VGAM2669 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2669 was detected is described hereinabove with reference to Figs. 2-8.

[37296] VGAM2669 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37297] VGAM2669 gene, herein designated VGAM GENE, encodes a VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2669 precursor RNA is designated SEQ ID:1841, and is provided hereinbelow with reference to the sequence listing part.

[37298] VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37299] An enzyme complex designated DICER COMPLEX, dices the VGAM2669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2669 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2669 RNA is designated SEQ ID:4911, and is provided hereinbelow with reference to the sequence listing part.

[37300] VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37301] VGAM2669 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2669 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2669 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37302] The complementary binding of VGAM2669 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2669 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2669 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37303] It is appreciated that VGAM2669 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2669 host target genes. The mRNA of each one of this plurality of VGAM2669 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2669 RNA, herein designated VGAM RNA, and which when bound by VGAM2669 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2669 host target proteins.

[37304] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2669 gene, herein designated VGAM GENE, on one or more VGAM2669 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37305] It is yet further appreciated that a function of VGAM2669 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2669 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2669 correlate with, and may be deduced from, the identity of the host target genes which VGAM2669 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37306] Nucleotide sequences of the VGAM2669 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2669 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2669 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2669 are further described hereinbelow with reference to Table 1.

[37307] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2669 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37308] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2670 (VGAM2670) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37309] VGAM2670 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2670 was detected is described hereinabove with reference to Figs. 2-8.

[37310] VGAM2670 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1. VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37311] VGAM2670 gene, herein designated VGAM GENE, encodes a VGAM2670 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2670 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2670 precursor RNA is designated SEQ ID:1847, and is provided hereinbelow with reference to the sequence listing part.

[37312] VGAM2670 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37313] An enzyme complex designated DICER COMPLEX, dices the VGAM2670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2670 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2670 RNA is designated SEQ ID:4917, and is provided hereinbelow with reference to the sequence listing part.

[37314] VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37315] VGAM2670 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2670 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2670 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37316] The complementary binding of VGAM2670 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2670 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2670 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37317] It is appreciated that VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2670 host target genes. The mRNA of each one of this plurality of VGAM2670 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2670 RNA, herein designated VGAM RNA, and which when bound by VGAM2670 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2670 host target proteins.

[37318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2670 gene, herein designated VGAM GENE, on one or more VGAM2670 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37319] It is yet further appreciated that a function of VGAM2670 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2670 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM2670 correlate with, and may be deduced from, the identity of the host target genes which VGAM2670 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37320] Nucleotide sequences of the VGAM2670 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2670 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2670 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2670 are further described hereinbelow with reference to Table 1.

[37321] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2670 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37322] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2671 (VGAM2671) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37323] VGAM2671 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2671 was detected is described hereinabove with reference to Figs. 2-8.

[37324] VGAM2671 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37325] VGAM2671 gene, herein designated VGAM GENE, encodes a VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2671 precursor RNA is designated SEQ ID:1836, and is provided hereinbelow with reference to the sequence listing part.

[37326] VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37327] An enzyme complex designated DICER COMPLEX, dices the VGAM2671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2671 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2671 RNA is designated SEQ ID:4906, and is provided hereinbelow with reference to the sequence listing part.

[37328] VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37329] VGAM2671 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2671 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2671 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37330] The complementary binding of VGAM2671 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2671 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2671 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37331] It is appreciated that VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2671 host target genes. The mRNA of

each one of this plurality of VGAM2671 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2671 RNA, herein designated VGAM RNA, and which when bound by VGAM2671 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2671 host target proteins.

[37332] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2671 gene, herein designated VGAM GENE, on one or more VGAM2671 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[37333] It is yet further appreciated that a function of VGAM2671 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2671 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2671 correlate with, and may be deduced from, the identity of the host target genes which VGAM2671 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37334] Nucleotide sequences of the VGAM2671 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2671 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2671 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2671 are further described hereinbelow with reference to Table 1.

[37335] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2671 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[37336] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2672 (VGAM2672) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37337] VGAM2672 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2672 was detected is described hereinabove with reference to Figs. 2-8.

[37338] VGAM2672 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37339] VGAM2672 gene, herein designated VGAM GENE, encodes a VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2672 precursor RNA is designated SEQ ID:1842, and is provided hereinbelow with reference to the sequence listing part.

[37340] VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37341] An enzyme complex designated DICER COMPLEX, dices the VGAM2672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2672 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2672 RNA is designated SEQ ID:4912, and

is provided hereinbelow with reference to the sequence listing part.

[37342] VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37343] VGAM2672 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2672 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2672 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37344] The complementary binding of VGAM2672 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2672 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2672 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37345] It is appreciated that VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2672 host target genes. The mRNA of each one of this plurality of VGAM2672 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2672 RNA, herein designated VGAM RNA, and which when bound by VGAM2672 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2672 host target proteins.

[37346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2672 gene, herein designated VGAM GENE, on one or more VGAM2672 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37347] It is yet further appreciated that a function of VGAM2672 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2672 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM2672 correlate with, and may be deduced from, the identity of the host target genes which VGAM2672 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37348] Nucleotide sequences of the VGAM2672 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2672 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2672 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2672 are further described hereinbelow with reference to Table 1.

[37349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2672 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37350] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2673 (VGAM2673) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37351] VGAM2673 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2673 was detected is described hereinabove with reference to Figs. 2-8.

[37352] VGAM2673 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37353] VGAM2673 gene, herein designated VGAM GENE, encodes a VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2673 precur-

sor RNA is designated SEQ ID:1837, and is provided hereinbelow with reference to the sequence listing part.

[37354] VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37355] An enzyme complex designated DICER COMPLEX, dices the VGAM2673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2673 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2673 RNA is designated SEQ ID:4907, and is provided hereinbelow with reference to the sequence

listing part.

[37356] VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37357] VGAM2673 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2673 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2673 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37358] The complementary binding of VGAM2673 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2673 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2673 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37359] It is appreciated that VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2673 host target genes. The mRNA of each one of this plurality of VGAM2673 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2673 RNA, herein designated VGAM RNA, and which when bound by VGAM2673 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2673 host target proteins.

[37360] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2673 gene, herein designated VGAM GENE, on one or more VGAM2673 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37361] It is yet further appreciated that a function of VGAM2673

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2673 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2673 correlate with, and may be deduced from, the identity of the host target genes which VGAM2673 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37362] Nucleotide sequences of the VGAM2673 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2673 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2673 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2673 are further described hereinbelow with reference to Table 1.

[37363] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2673 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37364] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2674 (VGAM2674) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37365] VGAM2674 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2674 was detected is described hereinabove with reference to Figs. 2-8.

[37366] VGAM2674 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37367] VGAM2674 gene, herein designated VGAM GENE, encodes a VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2674 precursor RNA is designated SEQ ID:1838, and is provided here-

inbelow with reference to the sequence listing part.

[37368] VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37369] An enzyme complex designated DICER COMPLEX, dices the VGAM2674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2674 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2674 RNA is designated SEQ ID:4908, and is provided hereinbelow with reference to the sequence listing part.

[37370] VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37371] VGAM2674 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2674 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2674 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37372] The complementary binding of VGAM2674 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2674 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2674 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37373] It is appreciated that VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2674 host target genes. The mRNA of each one of this plurality of VGAM2674 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2674 RNA, herein designated VGAM RNA, and which when bound by VGAM2674 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2674 host target proteins.

[37374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2674 gene, herein designated VGAM GENE, on one or more VGAM2674 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37375] It is yet further appreciated that a function of VGAM2674 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2674 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2674 correlate with, and may be deduced from, the identity of the host target genes which VGAM2674 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37376] Nucleotide sequences of the VGAM2674 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2674 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2674 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2674 are further described hereinbelow with reference to Table 1.

[37377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2674 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37378] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2675 (VGAM2675) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37379] VGAM2675 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2675 was detected is described hereinabove with reference to Figs. 2-8.

[37380] VGAM2675 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37381] VGAM2675 gene, herein designated VGAM GENE, encodes a VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2675 precursor RNA is designated SEQ ID:1839, and is provided hereinbelow with reference to the sequence listing part.

[37382] VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37383] An enzyme complex designated DICER COMPLEX, dices the VGAM2675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2675 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2675 RNA is designated SEQ ID:4909, and is provided hereinbelow with reference to the sequence listing part.

[37384] VGAM2675 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37385] VGAM2675 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2675 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2675 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37386] The complementary binding of VGAM2675 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2675 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2675 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37387] It is appreciated that VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2675 host target genes. The mRNA of each one of this plurality of VGAM2675 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2675 RNA, herein designated VGAM

RNA, and which when bound by VGAM2675 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2675 host target proteins.

[37388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2675 gene, herein designated VGAM GENE, on one or more VGAM2675 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37389] It is yet further appreciated that a function of VGAM2675 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2675 include diagnosis, prevention and treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM2675 correlate with, and may be deduced from, the identity of the host target genes which VGAM2675 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37390] Nucleotide sequences of the VGAM2675 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2675 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2675 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2675 are further described hereinbelow with reference to Table 1.

[37391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2675 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37392] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2676 (VGAM2676) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37393] VGAM2676 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2676 was detected is described hereinabove with reference to Figs. 2-8.

[37394] VGAM2676 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian paramyxovirus 6. VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37395] VGAM2676 gene, herein designated VGAM GENE, encodes a VGAM2676 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2676 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2676 precursor RNA is designated SEQ ID:1843, and is provided hereinbelow with reference to the sequence listing part.

[37396] VGAM2676 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37397] An enzyme complex designated DICER COMPLEX, dices the VGAM2676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2676 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2676 RNA is designated SEQ ID:4913, and is provided hereinbelow with reference to the sequence listing part.

[37398] VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37399] VGAM2676 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2676 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2676 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2676 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37400] The complementary binding of VGAM2676 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2676 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2676 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37401] It is appreciated that VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2676 host target genes. The mRNA of each one of this plurality of VGAM2676 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2676 RNA, herein designated VGAM RNA, and which when bound by VGAM2676 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2676 host target proteins.

[37402] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2676 gene, herein designated VGAM GENE, on one or more VGAM2676 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37403] It is yet further appreciated that a function of VGAM2676 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2676 include diagnosis, prevention and

treatment of viral infection by Avian paramyxovirus 6. Specific functions, and accordingly utilities, of VGAM2676 correlate with, and may be deduced from, the identity of the host target genes which VGAM2676 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37404] Nucleotide sequences of the VGAM2676 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2676 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2676 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2676 are further described hereinbelow with reference to Table 1.

[37405] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2676 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37406] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2677 (VGAM2677) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37407] VGAM2677 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2677 was detected is described hereinabove with reference to Figs. 2-8.

[37408] VGAM2677 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut clump virus. VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37409] VGAM2677 gene, herein designated VGAM GENE, encodes a VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2677 precursor RNA is designated SEQ ID:1844, and is provided hereinbelow with reference to the sequence listing part.

[37410] VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2677 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37411] An enzyme complex designated DICER COMPLEX, dices the VGAM2677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2677 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2677 RNA is designated SEQ ID:4914, and is provided hereinbelow with reference to the sequence listing part.

[37412] VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2677 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37413] VGAM2677 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2677 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2677 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37414] The complementary binding of VGAM2677 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2677 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2677 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37415] It is appreciated that VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2677 host target genes. The mRNA of each one of this plurality of VGAM2677 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2677 RNA, herein designated VGAM RNA, and which when bound by VGAM2677 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2677 host target proteins.

[37416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2677 gene, herein designated VGAM GENE, on one or more VGAM2677 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37417] It is yet further appreciated that a function of VGAM2677 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2677 include diagnosis, prevention and treatment of viral infection by Peanut clump virus. Specific

functions, and accordingly utilities, of VGAM2677 correlate with, and may be deduced from, the identity of the host target genes which VGAM2677 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37418] Nucleotide sequences of the VGAM2677 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2677 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2677 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2677 are further described hereinbelow with reference to Table 1.

[37419] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2677 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37420] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2678 (VGAM2678) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[37421] VGAM2678 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2678 was detected is described hereinabove with reference to Figs. 2-8.

[37422] VGAM2678 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37423] VGAM2678 gene, herein designated VGAM GENE, encodes a VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2678 precursor RNA is designated SEQ ID:1845, and is provided hereinbelow with reference to the sequence listing part.

[37424] VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2678 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37425] An enzyme complex designated DICER COMPLEX, dices the VGAM2678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2678 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2678 RNA is designated SEQ ID:4915, and is provided hereinbelow with reference to the sequence listing part.

[37426] VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2678 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37427] VGAM2678 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2678 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2678 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37428] The complementary binding of VGAM2678 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2678 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2678 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37429] It is appreciated that VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2678 host target genes. The mRNA of each one of this plurality of VGAM2678 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2678 RNA, herein designated VGAM RNA, and which when bound by VGAM2678 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2678 host target proteins.

[37430] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2678 gene, herein designated VGAM GENE, on one or more VGAM2678 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37431] It is yet further appreciated that a function of VGAM2678 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2678 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utili-

ties, of VGAM2678 correlate with, and may be deduced from, the identity of the host target genes which VGAM2678 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37432] Nucleotide sequences of the VGAM2678 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2678 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2678 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2678 are further described hereinbelow with reference to Table 1.

[37433] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2678 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37434] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2679 (VGAM2679) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[37435] VGAM2679 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2679 was detected is described hereinabove with reference to Figs. 2-8.

[37436] VGAM2679 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome mosaic virus. VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37437] VGAM2679 gene, herein designated VGAM GENE, encodes a VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2679 precursor RNA is designated SEQ ID:1848, and is provided hereinbelow with reference to the sequence listing part.

[37438] VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37439] An enzyme complex designated DICER COMPLEX, dices the VGAM2679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2679 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2679 RNA is designated SEQ ID:4918, and is provided hereinbelow with reference to the sequence listing part.

[37440] VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37441] VGAM2679 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2679 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2679 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37442] The complementary binding of VGAM2679 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2679 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2679 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37443] It is appreciated that VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2679 host target genes. The mRNA of each one of this plurality of VGAM2679 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2679 RNA, herein designated VGAM RNA, and which when bound by VGAM2679 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2679 host target proteins.

[37444] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2679 gene, herein designated VGAM GENE, on one or more VGAM2679 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37445] It is yet further appreciated that a function of VGAM2679 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2679 include diagnosis, prevention and treatment of viral infection by Brome mosaic virus. Specific functions, and accordingly utilities, of VGAM2679 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2679 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37446] Nucleotide sequences of the VGAM2679 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2679 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2679 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2679 are further described hereinbelow with reference to Table 1.

[37447] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2679 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37448] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2680 (VGAM2680) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37449] VGAM2680 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2680 was detected is described hereinabove with reference to Figs. 2-8.

[37450] VGAM2680 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 55. VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37451] VGAM2680 gene, herein designated VGAM GENE, encodes a VGAM2680 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2680 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2680 precursor RNA is designated SEQ ID:1853, and is provided hereinbelow with reference to the sequence listing part.

[37452] VGAM2680 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37453] An enzyme complex designated DICER COMPLEX, dices the VGAM2680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2680 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2680 RNA is designated SEQ ID:4923, and is provided hereinbelow with reference to the sequence listing part.

[37454] VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37455] VGAM2680 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2680 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2680 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37456] The complementary binding of VGAM2680 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2680 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2680 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37457] It is appreciated that VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2680 host target genes. The mRNA of each one of this plurality of VGAM2680 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2680 RNA, herein designated VGAM RNA, and which when bound by VGAM2680 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2680 host target proteins.

[37458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2680 gene, herein designated VGAM GENE, on one or more VGAM2680 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37459] It is yet further appreciated that a function of VGAM2680 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2680 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 55. Specific functions, and accordingly utilities, of VGAM2680 correlate with, and may be deduced from, the identity of the host target genes which VGAM2680 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37460] Nucleotide sequences of the VGAM2680 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2680 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2680 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2680 are further described hereinbelow with reference to Table 1.

[37461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2680 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37462] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2681 (VGAM2681) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37463] VGAM2681 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2681 was detected is described hereinabove with reference to Figs. 2-8.

[37464] VGAM2681 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 63. VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37465] VGAM2681 gene, herein designated VGAM GENE, encodes a VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2681 precursor RNA is designated SEQ ID:1854, and is provided hereinbelow with reference to the sequence listing part.

[37466] VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37467] An enzyme complex designated DICER COMPLEX, dices the VGAM2681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2681 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2681 RNA is designated SEQ ID:4924, and is provided hereinbelow with reference to the sequence listing part.

[37468] VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37469] VGAM2681 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2681 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2681 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[37470] The complementary binding of VGAM2681 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2681 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2681 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37471] It is appreciated that VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2681 host target genes. The mRNA of each one of this plurality of VGAM2681 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2681 RNA, herein designated VGAM RNA, and which when bound by VGAM2681 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2681 host target proteins.

[37472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2681 gene, herein designated VGAM GENE, on one or more VGAM2681 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37473] It is yet further appreciated that a function of VGAM2681 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2681 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 63. Specific functions, and accordingly utilities, of VGAM2681 correlate with, and may be deduced from, the identity of the host target genes which VGAM2681 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[37474] Nucleotide sequences of the VGAM2681 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2681 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2681 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2681 are further described hereinbelow with reference to Table 1.

[37475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2681 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37476] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2682 (VGAM2682) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37477] VGAM2682 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2682 was detected is described hereinabove with reference to Figs. 2-8.

[37478] VGAM2682 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 63. VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37479] VGAM2682 gene, herein designated VGAM GENE, encodes a VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2682 precursor RNA is designated SEQ ID:1860, and is provided hereinbelow with reference to the sequence listing part.

[37480] VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37481] An enzyme complex designated DICER COMPLEX, dices the VGAM2682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2682 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2682 RNA is designated SEQ ID:4930, and is provided hereinbelow with reference to the sequence listing part.

[37482] VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[37483] VGAM2682 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2682 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2682 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37484] The complementary binding of VGAM2682 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2682 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2682 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37485] It is appreciated that VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2682 host target genes. The mRNA of each one of this plurality of VGAM2682 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2682 RNA, herein designated VGAM RNA, and which when bound by VGAM2682 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2682 host target proteins.

[37486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2682 gene, herein designated VGAM GENE, on one

or more VGAM2682 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37487] It is yet further appreciated that a function of VGAM2682 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2682 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 63. Specific functions, and accordingly utilities, of VGAM2682 correlate with, and may be deduced from, the identity of the host target genes which VGAM2682 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37488] Nucleotide sequences of the VGAM2682 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2682 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2682 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2682 are further described hereinbelow with reference to Table 1.

[37489] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2682 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37490] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2683 (VGAM2683) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37491] VGAM2683 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2683 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[37492] VGAM2683 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 44. VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37493] VGAM2683 gene, herein designated VGAM GENE, encodes a VGAM2683 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2683 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2683 precursor RNA is designated SEQ ID:1855, and is provided hereinbelow with reference to the sequence listing part.

[37494] VGAM2683 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37495] An enzyme complex designated DICER COMPLEX, dices the VGAM2683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2683 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2683 RNA is designated SEQ ID:4925, and is provided hereinbelow with reference to the sequence listing part.

[37496] VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37497] VGAM2683 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2683 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2683 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37498] The complementary binding of VGAM2683 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2683 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2683 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37499] It is appreciated that VGAM2683 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2683 host target genes. The mRNA of each one of this plurality of VGAM2683 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2683 RNA, herein designated VGAM RNA, and which when bound by VGAM2683 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2683 host target proteins.

[37500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2683 gene, herein designated VGAM GENE, on one or more VGAM2683 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37501] It is yet further appreciated that a function of VGAM2683 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2683 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 44. Specific functions, and accordingly utilities, of VGAM2683 correlate with, and may be deduced from, the identity of the host target genes which VGAM2683 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37502] Nucleotide sequences of the VGAM2683 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2683 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2683 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2683 are further described hereinbelow with reference to Table 1.

[37503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2683 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37504] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2684 (VGAM2684) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37505] VGAM2684 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2684 was detected is described hereinabove with reference to Figs. 2-8.

[37506] VGAM2684 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 60. VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37507] VGAM2684 gene, herein designated VGAM GENE, encodes a VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2684 precursor RNA is designated SEQ ID:1849, and is provided hereinbelow with reference to the sequence listing part.

[37508] VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[37509] An enzyme complex designated DICER COMPLEX, dices the VGAM2684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2684 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2684 RNA is designated SEQ ID:4919, and is provided hereinbelow with reference to the sequence listing part.

[37510] VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37511] VGAM2684 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2684 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2684 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37512] The complementary binding of VGAM2684 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2684 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2684 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37513] It is appreciated that VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2684 host target genes. The mRNA of each one of this plurality of VGAM2684 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2684 RNA, herein designated VGAM RNA, and which when bound by VGAM2684 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2684 host target proteins.

[37514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2684 gene, herein designated VGAM GENE, on one or more VGAM2684 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37515] It is yet further appreciated that a function of VGAM2684 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2684 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 60. Specific functions, and accordingly utilities, of VGAM2684 correlate with, and may be deduced from, the identity of the host target genes which VGAM2684 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37516] Nucleotide sequences of the VGAM2684 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2684 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2684 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2684 are further described hereinbelow with reference to Table 1.

[37517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2684 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37518] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2685 (VGAM2685) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37519] VGAM2685 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2685 was detected is described hereinabove with reference to Figs. 2-8.

[37520] VGAM2685 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Pestivirus type 3. VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37521] VGAM2685 gene, herein designated VGAM GENE, encodes a VGAM2685 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2685 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2685 precursor RNA is designated SEQ ID:1850, and is provided hereinbelow with reference to the sequence listing part.

[37522] VGAM2685 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37523] An enzyme complex designated DICER COMPLEX, dices the VGAM2685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2685 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2685 RNA is designated SEQ ID:4920, and is provided hereinbelow with reference to the sequence listing part.

[37524] VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37525] VGAM2685 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2685 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2685 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37526] The complementary binding of VGAM2685 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2685 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2685 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2685 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37527] It is appreciated that VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2685 host target genes. The mRNA of each one of this plurality of VGAM2685 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2685 RNA, herein designated VGAM RNA, and which when bound by VGAM2685 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2685 host target proteins.

[37528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2685 gene, herein designated VGAM GENE, on one or more VGAM2685 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37529] It is yet further appreciated that a function of VGAM2685 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2685 include diagnosis, prevention and treatment of viral infection by Pestivirus type 3. Specific functions, and accordingly utilities, of VGAM2685 correlate with, and may be deduced from, the identity of the host target genes which VGAM2685 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37530] Nucleotide sequences of the VGAM2685 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2685 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2685 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2685 are further described hereinbelow with reference to Table 1.

[37531] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2685 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37532] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2686 (VGAM2686) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37533] VGAM2686 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2686 was detected is described hereinabove with reference to Figs. 2-8.

[37534] VGAM2686 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria

Chlorella virus 1. VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37535] VGAM2686 gene, herein designated VGAM GENE, encodes a VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2686 precursor RNA is designated SEQ ID:1851, and is provided hereinbelow with reference to the sequence listing part.

[37536] VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37537] An enzyme complex designated DICER COMPLEX, dices

the VGAM2686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2686 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2686 RNA is designated SEQ ID:4921, and is provided hereinbelow with reference to the sequence listing part.

[37538] VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37539] VGAM2686 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2686 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2686 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2686 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37540] The complementary binding of VGAM2686 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2686 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2686 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37541] It is appreciated that VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2686 host target genes. The mRNA of each one of this plurality of VGAM2686 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2686 RNA, herein designated VGAM RNA, and which when bound by VGAM2686 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2686 host target proteins.

[37542] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2686 gene, herein designated VGAM GENE, on one or more VGAM2686 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37543] It is yet further appreciated that a function of VGAM2686 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2686 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2686 correlate with, and may be deduced from, the identity of the host target genes which VGAM2686 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37544] Nucleotide sequences of the VGAM2686 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2686 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2686 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2686 are further described hereinbelow with reference to Table 1.

[37545] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2686 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37546] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2687 (VGAM2687) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37547] VGAM2687 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2687 was detected is described hereinabove with reference to Figs. 2-8.

[37548] VGAM2687 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 65. VGAM2687 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37549] VGAM2687 gene, herein designated VGAM GENE, encodes a VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2687 precursor RNA is designated SEQ ID:1852, and is provided hereinbelow with reference to the sequence listing part.

[37550] VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2687 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37551] An enzyme complex designated DICER COMPLEX, dices the VGAM2687 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2687 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2687 RNA is designated SEQ ID:4922, and is provided hereinbelow with reference to the sequence listing part.

[37552] VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37553] VGAM2687 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2687 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2687 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37554] The complementary binding of VGAM2687 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2687 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2687

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2687 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37555] It is appreciated that VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2687 host target genes. The mRNA of each one of this plurality of VGAM2687 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2687 RNA, herein designated VGAM RNA, and which when bound by VGAM2687 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2687 host target proteins.

[37556] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2687 gene, herein designated VGAM GENE, on one or more VGAM2687 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37557] It is yet further appreciated that a function of VGAM2687 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2687 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 65. Specific functions, and accordingly utilities, of VGAM2687 correlate with, and may be deduced from, the identity of the host target genes which VGAM2687 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37558] Nucleotide sequences of the VGAM2687 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2687 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2687 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2687 are further described hereinbelow with reference to Table 1.

[37559] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2687 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37560] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2688 (VGAM2688) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37561] VGAM2688 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2688 was detected is described hereinabove with reference to Figs. 2-8.

[37562] VGAM2688 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 25. VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[37563] VGAM2688 gene, herein designated VGAM GENE, encodes a VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2688 precursor RNA is designated SEQ ID:1856, and is provided hereinbelow with reference to the sequence listing part.

[37564] VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37565] An enzyme complex designated DICER COMPLEX, dices the VGAM2688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2688 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2688 RNA is designated SEQ ID:4926, and is provided hereinbelow with reference to the sequence listing part.

[37566] VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37567] VGAM2688 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2688 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2688 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37568] The complementary binding of VGAM2688 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2688 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2688 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2688 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37569] It is appreciated that VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2688 host target genes. The mRNA of each one of this plurality of VGAM2688 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2688 RNA, herein designated VGAM RNA, and which when bound by VGAM2688 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2688 host target proteins.

[37570] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2688 gene, herein designated VGAM GENE, on one or more VGAM2688 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37571] It is yet further appreciated that a function of VGAM2688 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2688 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 25. Specific functions, and accordingly utilities, of VGAM2688 correlate with, and may be deduced from, the identity of the host target genes which VGAM2688 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37572] Nucleotide sequences of the VGAM2688 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2688 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2688 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2688 are further

described hereinbelow with reference to Table 1.

[37573] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2688 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37574] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2689 (VGAM2689) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37575] VGAM2689 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2689 was detected is described hereinabove with reference to Figs. 2-8.

[37576] VGAM2689 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus.
VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37577] VGAM2689 gene, herein designated VGAM GENE, encodes a VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2689 precursor RNA is designated SEQ ID:1857, and is provided hereinbelow with reference to the sequence listing part.

[37578] VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37579] An enzyme complex designated DICER COMPLEX, dices the VGAM2689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2689 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2689 RNA is designated SEQ ID:4927, and is provided hereinbelow with reference to the sequence listing part.

[37580] VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37581] VGAM2689 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2689 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2689 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37582] The complementary binding of VGAM2689 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2689 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2689 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37583] It is appreciated that VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2689 host target genes. The mRNA of each one of this plurality of VGAM2689 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2689 RNA, herein designated VGAM RNA, and which when bound by VGAM2689 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2689 host target proteins.

[37584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2689 gene, herein designated VGAM GENE, on one or more VGAM2689 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37585] It is yet further appreciated that a function of VGAM2689 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2689 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2689 correlate with, and may be deduced from, the identity of the host target genes which VGAM2689 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37586] Nucleotide sequences of the VGAM2689 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2689 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2689 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2689 are further described hereinbelow with reference to Table 1.

[37587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2689 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37588] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2690 (VGAM2690) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37589] VGAM2690 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2690 was detected is described hereinabove with reference to Figs. 2-8.

[37590] VGAM2690 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37591] VGAM2690 gene, herein designated VGAM GENE, encodes

a VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2690 precursor RNA is designated SEQ ID:1858, and is provided hereinbelow with reference to the sequence listing part.

[37592] VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37593] An enzyme complex designated DICER COMPLEX, dices the VGAM2690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2690 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2690 RNA is designated SEQ ID:4928, and is provided hereinbelow with reference to the sequence listing part.

[37594] VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37595] VGAM2690 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2690 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2690 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37596] The complementary binding of VGAM2690 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2690 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2690 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[37597] It is appreciated that VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2690 host target genes. The mRNA of each one of this plurality of VGAM2690 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2690 RNA, herein designated VGAM RNA, and which when bound by VGAM2690 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2690 host target proteins.

[37598] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2690 gene, herein designated VGAM GENE, on one or more VGAM2690 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37599] It is yet further appreciated that a function of VGAM2690 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2690 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2690 correlate with, and may be deduced from, the identity of the host target genes which VGAM2690 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37600] Nucleotide sequences of the VGAM2690 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2690 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2690 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2690 are further described hereinbelow with reference to Table 1.

[37601] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2690 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37602] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2691 (VGAM2691) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37603] VGAM2691 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2691 was detected is described hereinabove with reference to Figs. 2-8.

[37604] VGAM2691 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37605] VGAM2691 gene, herein designated VGAM GENE, encodes a VGAM2691 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2691 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2691 precursor RNA is designated SEQ ID:1859, and is provided hereinbelow with reference to the sequence listing part.

[37606] VGAM2691 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37607] An enzyme complex designated DICER COMPLEX, dices the VGAM2691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2691 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2691 RNA is designated SEQ ID:4929, and is provided hereinbelow with reference to the sequence listing part.

[37608] VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37609] VGAM2691 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2691 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2691 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37610] The complementary binding of VGAM2691 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2691 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2691 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37611] It is appreciated that VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2691 host target genes. The mRNA of each one of this plurality of VGAM2691 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2691 RNA, herein designated VGAM RNA, and which when bound by VGAM2691 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2691 host target proteins.

[37612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2691 gene, herein designated VGAM GENE, on one or more VGAM2691 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37613] It is yet further appreciated that a function of VGAM2691 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2691 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2691 correlate with, and may be deduced from, the identity of the host target genes which VGAM2691 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37614] Nucleotide sequences of the VGAM2691 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2691 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2691 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2691 are further described hereinbelow with reference to Table 1.

[37615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2691 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37616] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2692 (VGAM2692) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37617] VGAM2692 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2692 was detected is described hereinabove with reference to Figs. 2-8.

[37618] VGAM2692 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37619] VGAM2692 gene, herein designated VGAM GENE, encodes a VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2692 precursor RNA is designated SEQ ID:1867, and is provided hereinbelow with reference to the sequence listing part.

[37620] VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37621] An enzyme complex designated DICER COMPLEX, dices the VGAM2692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2692 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2692 RNA is designated SEQ ID:4937, and is provided hereinbelow with reference to the sequence listing part.

[37622] VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37623] VGAM2692 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2692 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2692 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37624] The complementary binding of VGAM2692 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2692 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2692 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37625] It is appreciated that VGAM2692 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2692 host target genes. The mRNA of each one of this plurality of VGAM2692 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2692 RNA, herein designated VGAM RNA, and which when bound by VGAM2692 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2692 host target proteins.

[37626] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2692 gene, herein designated VGAM GENE, on one or more VGAM2692 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37627] It is yet further appreciated that a function of VGAM2692 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2692 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2692 correlate with, and may be deduced from, the identity of the host target genes which VGAM2692 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37628] Nucleotide sequences of the VGAM2692 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2692 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2692 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2692 are further described hereinbelow with reference to Table 1.

[37629] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2692 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37630] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2693 (VGAM2693) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37631] VGAM2693 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2693 was detected is described hereinabove with reference to Figs. 2-8.

[37632] VGAM2693 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37633] VGAM2693 gene, herein designated VGAM GENE, encodes a VGAM2693 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2693 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2693 precursor RNA is designated SEQ ID:1861, and is provided hereinbelow with reference to the sequence listing part.

[37634] VGAM2693 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37635] An enzyme complex designated DICER COMPLEX, dices the VGAM2693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2693 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2693 RNA is designated SEQ ID:4931, and is provided hereinbelow with reference to the sequence listing part.

[37636] VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37637] VGAM2693 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2693 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2693 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37638] The complementary binding of VGAM2693 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2693 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2693 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37639] It is appreciated that VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2693 host target genes. The mRNA of each one of this plurality of VGAM2693 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2693 RNA, herein designated VGAM RNA, and which when bound by VGAM2693 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2693 host target proteins.

[37640] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2693 gene, herein designated VGAM GENE, on one or more VGAM2693 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37641] It is yet further appreciated that a function of VGAM2693 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2693 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM2693 correlate with, and may be deduced from, the identity of the host target genes which VGAM2693 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37642] Nucleotide sequences of the VGAM2693 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2693 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2693 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2693 are further described hereinbelow with reference to Table 1.

[37643] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2693 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37644] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2694 (VGAM2694) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37645] VGAM2694 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2694 was detected is described hereinabove with reference to Figs. 2-8.

[37646] VGAM2694 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline immunodeficiency virus. VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37647] VGAM2694 gene, herein designated VGAM GENE, encodes a VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2694 precursor RNA is designated SEQ ID:1862, and is provided hereinbelow with reference to the sequence listing part.

[37648] VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37649] An enzyme complex designated DICER COMPLEX, dices the VGAM2694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2694 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide se-

quence of VGAM2694 RNA is designated SEQ ID:4932, and is provided hereinbelow with reference to the sequence listing part.

[37650] VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37651] VGAM2694 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2694 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2694 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37652] The complementary binding of VGAM2694 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2694 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2694 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37653] It is appreciated that VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2694 host target genes. The mRNA of

each one of this plurality of VGAM2694 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2694 RNA, herein designated VGAM RNA, and which when bound by VGAM2694 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2694 host target proteins.

[37654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2694 gene, herein designated VGAM GENE, on one or more VGAM2694 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[37655] It is yet further appreciated that a function of VGAM2694 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2694 include diagnosis, prevention and treatment of viral infection by Feline immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM2694 correlate with, and may be deduced from, the identity of the host target genes which VGAM2694 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37656] Nucleotide sequences of the VGAM2694 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2694 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2694 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2694 are further described hereinbelow with reference to Table 1.

[37657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2694 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[37658] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2695 (VGAM2695) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37659] VGAM2695 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2695 was detected is described hereinabove with reference to Figs. 2-8.

[37660] VGAM2695 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37661] VGAM2695 gene, herein designated VGAM GENE, encodes a VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2695 precursor RNA is designated SEQ ID:1863, and is provided hereinbelow with reference to the sequence listing part.

[37662] VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37663] An enzyme complex designated DICER COMPLEX, dices the VGAM2695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2695 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2695 RNA is designated SEQ ID:4933, and

is provided hereinbelow with reference to the sequence listing part.

[37664] VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37665] VGAM2695 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2695 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2695 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37666] The complementary binding of VGAM2695 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2695 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2695 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37667] It is appreciated that VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2695 host target genes. The mRNA of each one of this plurality of VGAM2695 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2695 RNA, herein designated VGAM RNA, and which when bound by VGAM2695 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2695 host target proteins.

[37668] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2695 gene, herein designated VGAM GENE, on one or more VGAM2695 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37669] It is yet further appreciated that a function of VGAM2695 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2695 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2695 correlate with, and may be deduced from, the identity of the host target genes which VGAM2695 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37670] Nucleotide sequences of the VGAM2695 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2695 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2695 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2695 are further described hereinbelow with reference to Table 1.

[37671] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2695 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37672] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2696 (VGAM2696) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37673] VGAM2696 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2696 was detected is described hereinabove with reference to Figs. 2-8.

[37674] VGAM2696 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 15. VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37675] VGAM2696 gene, herein designated VGAM GENE, encodes a VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2696 precur-

sor RNA is designated SEQ ID:1868, and is provided hereinbelow with reference to the sequence listing part.

[37676] VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37677] An enzyme complex designated DICER COMPLEX, dices the VGAM2696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2696 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2696 RNA is designated SEQ ID:4938, and is provided hereinbelow with reference to the sequence

listing part.

[37678] VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37679] VGAM2696 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2696 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2696 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37680] The complementary binding of VGAM2696 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2696 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2696 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37681] It is appreciated that VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2696 host target genes. The mRNA of each one of this plurality of VGAM2696 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2696 RNA, herein designated VGAM RNA, and which when bound by VGAM2696 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2696 host target proteins.

[37682] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2696 gene, herein designated VGAM GENE, on one or more VGAM2696 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37683] It is yet further appreciated that a function of VGAM2696

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2696 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 15. Specific functions, and accordingly utilities, of VGAM2696 correlate with, and may be deduced from, the identity of the host target genes which VGAM2696 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37684] Nucleotide sequences of the VGAM2696 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2696 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2696 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2696 are further described hereinbelow with reference to Table 1.

[37685] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2696 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37686] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2697 (VGAM2697) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37687] VGAM2697 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2697 was detected is described hereinabove with reference to Figs. 2-8.

[37688] VGAM2697 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 9. VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37689] VGAM2697 gene, herein designated VGAM GENE, encodes a VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2697 precursor RNA is designated SEQ ID:1869, and is provided here-

inbelow with reference to the sequence listing part.

[37690] VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37691] An enzyme complex designated DICER COMPLEX, dices the VGAM2697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2697 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2697 RNA is designated SEQ ID:4939, and is provided hereinbelow with reference to the sequence listing part.

[37692] VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37693] VGAM2697 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2697 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2697 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37694] The complementary binding of VGAM2697 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2697 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2697 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37695] It is appreciated that VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2697 host target genes. The mRNA of each one of this plurality of VGAM2697 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2697 RNA, herein designated VGAM RNA, and which when bound by VGAM2697 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2697 host target proteins.

[37696] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2697 gene, herein designated VGAM GENE, on one or more VGAM2697 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37697] It is yet further appreciated that a function of VGAM2697 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2697 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 9. Specific functions, and accordingly utilities, of VGAM2697 correlate with, and may be deduced from, the identity of the host target genes which VGAM2697 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37698] Nucleotide sequences of the VGAM2697 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2697 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2697 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2697 are further described hereinbelow with reference to Table 1.

[37699] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2697 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37700] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2698 (VGAM2698) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37701] VGAM2698 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2698 was detected is described hereinabove with reference to Figs. 2-8.

[37702] VGAM2698 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37703] VGAM2698 gene, herein designated VGAM GENE, encodes a VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2698 precursor RNA is designated SEQ ID:1864, and is provided hereinbelow with reference to the sequence listing part.

[37704] VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37705] An enzyme complex designated DICER COMPLEX, dices the VGAM2698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2698 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2698 RNA is designated SEQ ID:4934, and is provided hereinbelow with reference to the sequence listing part.

[37706] VGAM2698 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37707] VGAM2698 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2698 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2698 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37708] The complementary binding of VGAM2698 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2698 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2698 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37709] It is appreciated that VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2698 host target genes. The mRNA of each one of this plurality of VGAM2698 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2698 RNA, herein designated VGAM

RNA, and which when bound by VGAM2698 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2698 host target proteins.

[37710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2698 gene, herein designated VGAM GENE, on one or more VGAM2698 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37711] It is yet further appreciated that a function of VGAM2698 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2698 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2698 correlate with, and may be deduced from, the identity of the host target genes which VGAM2698 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37712] Nucleotide sequences of the VGAM2698 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2698 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2698 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2698 are further described hereinbelow with reference to Table 1.

[37713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2698 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37714] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2699 (VGAM2699) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37715] VGAM2699 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2699 was detected is described hereinabove with reference to Figs. 2-8.

[37716] VGAM2699 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37717] VGAM2699 gene, herein designated VGAM GENE, encodes a VGAM2699 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2699 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2699 precursor RNA is designated SEQ ID:1870, and is provided hereinbelow with reference to the sequence listing part.

[37718] VGAM2699 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37719] An enzyme complex designated DICER COMPLEX, dices the VGAM2699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2699 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2699 RNA is designated SEQ ID:4940, and is provided hereinbelow with reference to the sequence listing part.

[37720] VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37721] VGAM2699 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2699 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2699 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2699 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37722] The complementary binding of VGAM2699 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2699 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2699 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37723] It is appreciated that VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2699 host target genes. The mRNA of each one of this plurality of VGAM2699 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2699 RNA, herein designated VGAM RNA, and which when bound by VGAM2699 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2699 host target proteins.

[37724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2699 gene, herein designated VGAM GENE, on one

or more VGAM2699 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37725] It is yet further appreciated that a function of VGAM2699 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2699 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2699 correlate with, and may be deduced from, the identity of the host target genes which VGAM2699 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37726] Nucleotide sequences of the VGAM2699 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2699 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2699 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2699 are further described hereinbelow with reference to Table 1.

[37727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2699 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37728] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2700 (VGAM2700) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37729] VGAM2700 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2700 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[37730] VGAM2700 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37731] VGAM2700 gene, herein designated VGAM GENE, encodes a VGAM2700 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2700 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2700 precursor RNA is designated SEQ ID:1865, and is provided hereinbelow with reference to the sequence listing part.

[37732] VGAM2700 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37733] An enzyme complex designated DICER COMPLEX, dices the VGAM2700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2700 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2700 RNA is designated SEQ ID:4935, and is provided hereinbelow with reference to the sequence listing part.

[37734] VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37735] VGAM2700 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2700 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2700 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37736] The complementary binding of VGAM2700 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2700 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2700 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37737] It is appreciated that VGAM2700 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2700 host target genes. The mRNA of each one of this plurality of VGAM2700 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2700 RNA, herein designated VGAM RNA, and which when bound by VGAM2700 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2700 host target proteins.

[37738] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2700 gene, herein designated VGAM GENE, on one or more VGAM2700 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37739] It is yet further appreciated that a function of VGAM2700 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2700 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2700 correlate with, and may be deduced from, the identity of the host target genes which VGAM2700 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37740] Nucleotide sequences of the VGAM2700 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2700 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2700 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2700 are further described hereinbelow with reference to Table 1.

[37741] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2700 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37742] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2701 (VGAM2701) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37743] VGAM2701 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2701 was detected is described hereinabove with reference to Figs. 2-8.

[37744] VGAM2701 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37745] VGAM2701 gene, herein designated VGAM GENE, encodes a VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2701 precursor RNA is designated SEQ ID:1871, and is provided hereinbelow with reference to the sequence listing part.

[37746] VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[37747] An enzyme complex designated DICER COMPLEX, dices the VGAM2701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2701 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2701 RNA is designated SEQ ID:4941, and is provided hereinbelow with reference to the sequence listing part.

[37748] VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37749] VGAM2701 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2701 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2701 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37750] The complementary binding of VGAM2701 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2701 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2701 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37751] It is appreciated that VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2701 host target genes. The mRNA of each one of this plurality of VGAM2701 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2701 RNA, herein designated VGAM RNA, and which when bound by VGAM2701 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2701 host target proteins.

[37752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2701 gene, herein designated VGAM GENE, on one or more VGAM2701 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37753] It is yet further appreciated that a function of VGAM2701 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2701 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2701 correlate with, and may be deduced from, the identity of the host target genes which VGAM2701 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37754] Nucleotide sequences of the VGAM2701 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2701 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2701 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2701 are further described hereinbelow with reference to Table 1.

[37755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2701 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37756] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2702 (VGAM2702) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37757] VGAM2702 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2702 was detected is described hereinabove with reference to Figs. 2-8.

[37758] VGAM2702 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus. VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37759] VGAM2702 gene, herein designated VGAM GENE, encodes a VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2702 precursor RNA is designated SEQ ID:1872, and is provided hereinbelow with reference to the sequence listing part.

[37760] VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37761] An enzyme complex designated DICER COMPLEX, dices the VGAM2702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2702 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2702 RNA is designated SEQ ID:4942, and is provided hereinbelow with reference to the sequence listing part.

[37762] VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37763] VGAM2702 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2702 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2702 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37764] The complementary binding of VGAM2702 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2702 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2702 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2702 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37765] It is appreciated that VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2702 host target genes. The mRNA of each one of this plurality of VGAM2702 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2702 RNA, herein designated VGAM RNA, and which when bound by VGAM2702 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2702 host target proteins.

[37766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2702 gene, herein designated VGAM GENE, on one or more VGAM2702 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37767] It is yet further appreciated that a function of VGAM2702 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2702 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2702 correlate with, and may be deduced from, the identity of the host target genes which VGAM2702 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37768] Nucleotide sequences of the VGAM2702 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2702 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2702 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2702 are further described hereinbelow with reference to Table 1.

[37769] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2702 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37770] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2703 (VGAM2703) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37771] VGAM2703 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2703 was detected is described hereinabove with reference to Figs. 2-8.

[37772] VGAM2703 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine her-

pesvirus 7. VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37773] VGAM2703 gene, herein designated VGAM GENE, encodes a VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2703 precursor RNA is designated SEQ ID:1873, and is provided hereinbelow with reference to the sequence listing part.

[37774] VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37775] An enzyme complex designated DICER COMPLEX, dices

the VGAM2703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2703 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2703 RNA is designated SEQ ID:4943, and is provided hereinbelow with reference to the sequence listing part.

[37776] VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37777] VGAM2703 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2703 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2703 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2703 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37778] The complementary binding of VGAM2703 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2703 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2703 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37779] It is appreciated that VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2703 host target genes. The mRNA of each one of this plurality of VGAM2703 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2703 RNA, herein designated VGAM RNA, and which when bound by VGAM2703 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2703 host target proteins.

[37780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2703 gene, herein designated VGAM GENE, on one or more VGAM2703 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37781] It is yet further appreciated that a function of VGAM2703 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2703 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2703 correlate with, and may be deduced from, the identity of the host target genes which VGAM2703 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37782] Nucleotide sequences of the VGAM2703 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2703 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2703 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2703 are further described hereinbelow with reference to Table 1.

[37783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2703 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37784] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2704 (VGAM2704) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37785] VGAM2704 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2704 was detected is described hereinabove with reference to Figs. 2-8.

[37786] VGAM2704 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 89. VGAM2704 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37787] VGAM2704 gene, herein designated VGAM GENE, encodes a VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2704 precursor RNA is designated SEQ ID:1866, and is provided hereinbelow with reference to the sequence listing part.

[37788] VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2704 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37789] An enzyme complex designated DICER COMPLEX, dices the VGAM2704 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2704 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2704 RNA is designated SEQ ID:4936, and is provided hereinbelow with reference to the sequence listing part.

[37790] VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37791] VGAM2704 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2704 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2704 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37792] The complementary binding of VGAM2704 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2704 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2704

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2704 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37793] It is appreciated that VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2704 host target genes. The mRNA of each one of this plurality of VGAM2704 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2704 RNA, herein designated VGAM RNA, and which when bound by VGAM2704 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2704 host target proteins.

[37794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2704 gene, herein designated VGAM GENE, on one or more VGAM2704 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37795] It is yet further appreciated that a function of VGAM2704 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2704 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 89. Specific functions, and accordingly utilities, of VGAM2704 correlate with, and may be deduced from, the identity of the host target genes which VGAM2704 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37796] Nucleotide sequences of the VGAM2704 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2704 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2704 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2704 are further described hereinbelow with reference to Table 1.

[37797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2704 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37798] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2705 (VGAM2705) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37799] VGAM2705 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2705 was detected is described hereinabove with reference to Figs. 2-8.

[37800] VGAM2705 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 84. VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[37801] VGAM2705 gene, herein designated VGAM GENE, encodes a VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2705 precursor RNA is designated SEQ ID:1874, and is provided hereinbelow with reference to the sequence listing part.

[37802] VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37803] An enzyme complex designated DICER COMPLEX, dices the VGAM2705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2705 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2705 RNA is designated SEQ ID:4944, and is provided hereinbelow with reference to the sequence listing part.

[37804] VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37805] VGAM2705 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2705 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2705 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37806] The complementary binding of VGAM2705 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2705 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2705 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2705 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37807] It is appreciated that VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2705 host target genes. The mRNA of each one of this plurality of VGAM2705 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2705 RNA, herein designated VGAM RNA, and which when bound by VGAM2705 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2705 host target proteins.

[37808] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2705 gene, herein designated VGAM GENE, on one or more VGAM2705 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37809] It is yet further appreciated that a function of VGAM2705 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2705 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 84. Specific functions, and accordingly utilities, of VGAM2705 correlate with, and may be deduced from, the identity of the host target genes which VGAM2705 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37810] Nucleotide sequences of the VGAM2705 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2705 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2705 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2705 are further

described hereinbelow with reference to Table 1.

[37811] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2705 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37812] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2706 (VGAM2706) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37813] VGAM2706 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2706 was detected is described hereinabove with reference to Figs. 2-8.

[37814] VGAM2706 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37815] VGAM2706 gene, herein designated VGAM GENE, encodes a VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2706 precursor RNA is designated SEQ ID:1875, and is provided hereinbelow with reference to the sequence listing part.

[37816] VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37817] An enzyme complex designated DICER COMPLEX, dices the VGAM2706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2706 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2706 RNA is designated SEQ ID:4945, and is provided hereinbelow with reference to the sequence listing part.

[37818] VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37819] VGAM2706 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2706 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2706 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37820] The complementary binding of VGAM2706 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2706 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2706 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37821] It is appreciated that VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2706 host target genes. The mRNA of each one of this plurality of VGAM2706 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2706 RNA, herein designated VGAM RNA, and which when bound by VGAM2706 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2706 host target proteins.

[37822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2706 gene, herein designated VGAM GENE, on one or more VGAM2706 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37823] It is yet further appreciated that a function of VGAM2706 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2706 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2706 correlate with, and may be deduced from, the identity of the host target genes which VGAM2706 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37824] Nucleotide sequences of the VGAM2706 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2706 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2706 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2706 are further described hereinbelow with reference to Table 1.

[37825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2706 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37826] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2707 (VGAM2707) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37827] VGAM2707 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2707 was detected is described hereinabove with reference to Figs. 2-8.

[37828] VGAM2707 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine adenovirus B. VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37829] VGAM2707 gene, herein designated VGAM GENE, encodes

a VGAM2707 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2707 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2707 precursor RNA is designated SEQ ID:1876, and is provided hereinbelow with reference to the sequence listing part.

[37830] VGAM2707 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37831] An enzyme complex designated DICER COMPLEX, dices the VGAM2707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2707 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2707 RNA is designated SEQ ID:4946, and is provided hereinbelow with reference to the sequence listing part.

[37832] VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37833] VGAM2707 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2707 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2707 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37834] The complementary binding of VGAM2707 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2707 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2707 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[37835] It is appreciated that VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2707 host target genes. The mRNA of each one of this plurality of VGAM2707 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2707 RNA, herein designated VGAM RNA, and which when bound by VGAM2707 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2707 host target proteins.

[37836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2707 gene, herein designated VGAM GENE, on one or more VGAM2707 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37837] It is yet further appreciated that a function of VGAM2707 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2707 include diagnosis, prevention and treatment of viral infection by Bovine adenovirus B. Specific functions, and accordingly utilities, of VGAM2707 correlate with, and may be deduced from, the identity of the host target genes which VGAM2707 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37838] Nucleotide sequences of the VGAM2707 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2707 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2707 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2707 are further described hereinbelow with reference to Table 1.

[37839] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2707 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37840] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2708 (VGAM2708) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37841] VGAM2708 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2708 was detected is described hereinabove with reference to Figs. 2-8.

[37842] VGAM2708 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM2708 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37843] VGAM2708 gene, herein designated VGAM GENE, encodes a VGAM2708 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2708 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2708 precursor RNA is designated SEQ ID:1877, and is provided hereinbelow with reference to the sequence listing part.

[37844] VGAM2708 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37845] An enzyme complex designated DICER COMPLEX, dices the VGAM2708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2708 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2708 RNA is designated SEQ ID:4947, and is provided hereinbelow with reference to the sequence listing part.

[37846] VGAM2708 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37847] VGAM2708 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2708 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2708 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37848] The complementary binding of VGAM2708 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2708 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2708 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37849] It is appreciated that VGAM2708 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2708 host target genes. The mRNA of each one of this plurality of VGAM2708 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2708 RNA, herein designated VGAM RNA, and which when bound by VGAM2708 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2708 host target proteins.

[37850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2708 gene, herein designated VGAM GENE, on one or more VGAM2708 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37851] It is yet further appreciated that a function of VGAM2708 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2708 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM2708 correlate with, and may be deduced from, the identity of the host target genes which VGAM2708 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37852] Nucleotide sequences of the VGAM2708 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2708 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2708 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2708 are further described hereinbelow with reference to Table 1.

[37853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2708 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37854] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2709 (VGAM2709) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37855] VGAM2709 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2709 was detected is described hereinabove with reference to Figs. 2-8.

[37856] VGAM2709 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper mottle virus. VGAM2709 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37857] VGAM2709 gene, herein designated VGAM GENE, encodes a VGAM2709 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2709 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2709 precursor RNA is designated SEQ ID:2724, and is provided hereinbelow with reference to the sequence listing part.

[37858] VGAM2709 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37859] An enzyme complex designated DICER COMPLEX, dices the VGAM2709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2709 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2709 RNA is designated SEQ ID:5794, and is provided hereinbelow with reference to the sequence listing part.

[37860] VGAM2709 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37861] VGAM2709 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2709 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2709 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37862] The complementary binding of VGAM2709 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2709 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2709 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37863] It is appreciated that VGAM2709 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2709 host target genes. The mRNA of each one of this plurality of VGAM2709 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2709 RNA, herein designated VGAM RNA, and which when bound by VGAM2709 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2709 host target proteins.

[37864] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2709 gene, herein designated VGAM GENE, on one or more VGAM2709 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37865] It is yet further appreciated that a function of VGAM2709 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2709 include diagnosis, prevention and treatment of viral infection by Pepper mottle virus. Specific functions, and accordingly utilities, of VGAM2709 correlate with, and may be deduced from, the identity of the host target genes which VGAM2709 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37866] Nucleotide sequences of the VGAM2709 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2709 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2709 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2709 are further described hereinbelow with reference to Table 1.

[37867] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2709 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37868] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2710 (VGAM2710) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37869] VGAM2710 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2710 was detected is described hereinabove with reference to Figs. 2-8.

[37870] VGAM2710 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2710 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37871] VGAM2710 gene, herein designated VGAM GENE, encodes a VGAM2710 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2710 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2710 precursor RNA is designated SEQ ID:1878, and is provided hereinbelow with reference to the sequence listing part.

[37872] VGAM2710 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37873] An enzyme complex designated DICER COMPLEX, dices the VGAM2710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2710 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2710 RNA is designated SEQ ID:4948, and is provided hereinbelow with reference to the sequence listing part.

[37874] VGAM2710 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37875] VGAM2710 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2710 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2710 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37876] The complementary binding of VGAM2710 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2710 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2710 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37877] It is appreciated that VGAM2710 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2710 host target genes. The mRNA of each one of this plurality of VGAM2710 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2710 RNA, herein designated VGAM RNA, and which when bound by VGAM2710 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2710 host target proteins.

[37878] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2710 gene, herein designated VGAM GENE, on one or more VGAM2710 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37879] It is yet further appreciated that a function of VGAM2710 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2710 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2710 correlate with, and may be deduced from, the identity of the host target genes which VGAM2710 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37880] Nucleotide sequences of the VGAM2710 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2710 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2710 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2710 are further described hereinbelow with reference to Table 1.

[37881] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2710 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37882] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2711 (VGAM2711) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37883] VGAM2711 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2711 was detected is described hereinabove with reference to Figs. 2-8.

[37884] VGAM2711 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2711 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37885] VGAM2711 gene, herein designated VGAM GENE, encodes a VGAM2711 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2711 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2711 precursor RNA is designated SEQ ID:1879, and is provided hereinbelow with reference to the sequence listing part.

[37886] VGAM2711 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37887] An enzyme complex designated DICER COMPLEX, dices the VGAM2711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2711 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2711 RNA is designated SEQ ID:4949, and is provided hereinbelow with reference to the sequence listing part.

[37888] VGAM2711 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37889] VGAM2711 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2711 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2711 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37890] The complementary binding of VGAM2711 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2711 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2711 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37891] It is appreciated that VGAM2711 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2711 host target genes. The mRNA of

each one of this plurality of VGAM2711 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2711 RNA, herein designated VGAM RNA, and which when bound by VGAM2711 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2711 host target proteins.

[37892] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2711 gene, herein designated VGAM GENE, on one or more VGAM2711 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[37893] It is yet further appreciated that a function of VGAM2711 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2711 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2711 correlate with, and may be deduced from, the identity of the host target genes which VGAM2711 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37894] Nucleotide sequences of the VGAM2711 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2711 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2711 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2711 are further described hereinbelow with reference to Table 1.

[37895] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2711 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[37896] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2712 (VGAM2712) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37897] VGAM2712 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2712 was detected is described hereinabove with reference to Figs. 2-8.

[37898] VGAM2712 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM2712 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37899] VGAM2712 gene, herein designated VGAM GENE, encodes a VGAM2712 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2712 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2712 precursor RNA is designated SEQ ID:1880, and is provided hereinbelow with reference to the sequence listing part.

[37900] VGAM2712 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37901] An enzyme complex designated DICER COMPLEX, dices the VGAM2712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2712 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2712 RNA is designated SEQ ID:4950, and

is provided hereinbelow with reference to the sequence listing part.

[37902] VGAM2712 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37903] VGAM2712 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2712 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2712 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37904] The complementary binding of VGAM2712 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2712 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2712 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37905] It is appreciated that VGAM2712 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2712 host target genes. The mRNA of each one of this plurality of VGAM2712 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2712 RNA, herein designated VGAM RNA, and which when bound by VGAM2712 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2712 host target proteins.

[37906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2712 gene, herein designated VGAM GENE, on one or more VGAM2712 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37907] It is yet further appreciated that a function of VGAM2712 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2712 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2712 correlate with, and may be deduced from, the identity of the host target genes which VGAM2712 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37908] Nucleotide sequences of the VGAM2712 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2712 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2712 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2712 are further described hereinbelow with reference to Table 1.

[37909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2712 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37910] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2713 (VGAM2713) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37911] VGAM2713 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2713 was detected is described hereinabove with reference to Figs. 2-8.

[37912] VGAM2713 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Mouse parvovirus 1. VGAM2713 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37913] VGAM2713 gene, herein designated VGAM GENE, encodes a VGAM2713 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2713 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2713 precur-

sor RNA is designated SEQ ID:1881, and is provided hereinbelow with reference to the sequence listing part.

[37914] VGAM2713 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37915] An enzyme complex designated DICER COMPLEX, dices the VGAM2713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2713 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2713 RNA is designated SEQ ID:4951, and is provided hereinbelow with reference to the sequence

listing part.

[37916] VGAM2713 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37917] VGAM2713 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2713 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2713 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37918] The complementary binding of VGAM2713 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2713 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2713 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37919] It is appreciated that VGAM2713 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2713 host target genes. The mRNA of each one of this plurality of VGAM2713 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2713 RNA, herein designated VGAM RNA, and which when bound by VGAM2713 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2713 host target proteins.

[37920] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2713 gene, herein designated VGAM GENE, on one or more VGAM2713 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37921] It is yet further appreciated that a function of VGAM2713

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2713 include diagnosis, prevention and treatment of viral infection by Mouse parvovirus 1. Specific functions, and accordingly utilities, of VGAM2713 correlate with, and may be deduced from, the identity of the host target genes which VGAM2713 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37922] Nucleotide sequences of the VGAM2713 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2713 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2713 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2713 are further described hereinbelow with reference to Table 1.

[37923] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2713 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37924] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2714 (VGAM2714) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37925] VGAM2714 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2714 was detected is described hereinabove with reference to Figs. 2-8.

[37926] VGAM2714 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid herpesvirus 4. VGAM2714 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37927] VGAM2714 gene, herein designated VGAM GENE, encodes a VGAM2714 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2714 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2714 precursor RNA is designated SEQ ID:2725, and is provided here-

inbelow with reference to the sequence listing part.

[37928] VGAM2714 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37929] An enzyme complex designated DICER COMPLEX, dices the VGAM2714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2714 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2714 RNA is designated SEQ ID:5795, and is provided hereinbelow with reference to the sequence listing part.

[37930] VGAM2714 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37931] VGAM2714 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2714 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2714 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37932] The complementary binding of VGAM2714 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2714 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2714 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37933] It is appreciated that VGAM2714 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2714 host target genes. The mRNA of each one of this plurality of VGAM2714 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2714 RNA, herein designated VGAM RNA, and which when bound by VGAM2714 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2714 host target proteins.

[37934] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2714 gene, herein designated VGAM GENE, on one or more VGAM2714 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37935] It is yet further appreciated that a function of VGAM2714 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2714 include diagnosis, prevention and treatment of viral infection by Murid herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2714 correlate with, and may be deduced from, the identity of the host target genes which VGAM2714 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37936] Nucleotide sequences of the VGAM2714 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2714 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2714 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2714 are further described hereinbelow with reference to Table 1.

[37937] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2714 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37938] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2715 (VGAM2715) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37939] VGAM2715 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2715 was detected is described hereinabove with reference to Figs. 2-8.

[37940] VGAM2715 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2715 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37941] VGAM2715 gene, herein designated VGAM GENE, encodes a VGAM2715 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2715 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2715 precursor RNA is designated SEQ ID:2726, and is provided hereinbelow with reference to the sequence listing part.

[37942] VGAM2715 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37943] An enzyme complex designated DICER COMPLEX, dices the VGAM2715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2715 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2715 RNA is designated SEQ ID:5796, and is provided hereinbelow with reference to the sequence listing part.

[37944] VGAM2715 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37945] VGAM2715 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2715 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2715 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37946] The complementary binding of VGAM2715 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2715 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2715 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37947] It is appreciated that VGAM2715 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2715 host target genes. The mRNA of each one of this plurality of VGAM2715 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2715 RNA, herein designated VGAM

RNA, and which when bound by VGAM2715 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2715 host target proteins.

[37948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2715 gene, herein designated VGAM GENE, on one or more VGAM2715 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37949] It is yet further appreciated that a function of VGAM2715 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2715 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2715 correlate with, and may be deduced from, the identity of the host target genes which VGAM2715 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37950] Nucleotide sequences of the VGAM2715 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2715 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2715 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2715 are further described hereinbelow with reference to Table 1.

[37951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2715 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37952] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2716 (VGAM2716) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37953] VGAM2716 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2716 was detected is described hereinabove with reference to Figs. 2-8.

[37954] VGAM2716 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Red clover mottle virus. VGAM2716 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37955] VGAM2716 gene, herein designated VGAM GENE, encodes a VGAM2716 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2716 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2716 precursor RNA is designated SEQ ID:2727, and is provided hereinbelow with reference to the sequence listing part.

[37956] VGAM2716 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37957] An enzyme complex designated DICER COMPLEX, dices the VGAM2716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2716 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2716 RNA is designated SEQ ID:5797, and is provided hereinbelow with reference to the sequence listing part.

[37958] VGAM2716 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2716 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2716 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37959] VGAM2716 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2716 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2716 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2716 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2716 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37960] The complementary binding of VGAM2716 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2716 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2716 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2716 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37961] It is appreciated that VGAM2716 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2716 host target genes. The mRNA of each one of this plurality of VGAM2716 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2716 RNA, herein designated VGAM RNA, and which when bound by VGAM2716 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2716 host target proteins.

[37962] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2716 gene, herein designated VGAM GENE, on one or more VGAM2716 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37963] It is yet further appreciated that a function of VGAM2716 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2716 include diagnosis, prevention and

treatment of viral infection by Red clover mottle virus. Specific functions, and accordingly utilities, of VGAM2716 correlate with, and may be deduced from, the identity of the host target genes which VGAM2716 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37964] Nucleotide sequences of the VGAM2716 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2716 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2716 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2716 are further described hereinbelow with reference to Table 1.

[37965] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2716 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37966] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2717 (VGAM2717) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[37967] VGAM2717 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2717 was detected is described hereinabove with reference to Figs. 2-8.

[37968] VGAM2717 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine pulmonary adenocarcinoma virus. VGAM2717 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37969] VGAM2717 gene, herein designated VGAM GENE, encodes a VGAM2717 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2717 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2717 precursor RNA is designated SEQ ID:2731, and is provided hereinbelow with reference to the sequence listing part.

[37970] VGAM2717 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2717 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37971] An enzyme complex designated DICER COMPLEX, dices the VGAM2717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2717 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2717 RNA is designated SEQ ID:5801, and is provided hereinbelow with reference to the sequence listing part.

[37972] VGAM2717 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2717 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2717 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37973] VGAM2717 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2717 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2717 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2717 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2717 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37974] The complementary binding of VGAM2717 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2717 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2717 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2717 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37975] It is appreciated that VGAM2717 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2717 host target genes. The mRNA of each one of this plurality of VGAM2717 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2717 RNA, herein designated VGAM RNA, and which when bound by VGAM2717 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2717 host target proteins.

[37976] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2717 gene, herein designated VGAM GENE, on one or more VGAM2717 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37977] It is yet further appreciated that a function of VGAM2717 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2717 include diagnosis, prevention and treatment of viral infection by Ovine pulmonary adenocar-

cinoma virus. Specific functions, and accordingly utilities, of VGAM2717 correlate with, and may be deduced from, the identity of the host target genes which VGAM2717 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37978] Nucleotide sequences of the VGAM2717 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2717 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2717 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2717 are further described hereinbelow with reference to Table 1.

[37979] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2717 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37980] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2718 (VGAM2718) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[37981] VGAM2718 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2718 was detected is described hereinabove with reference to Figs. 2-8.

[37982] VGAM2718 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2718 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37983] VGAM2718 gene, herein designated VGAM GENE, encodes a VGAM2718 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2718 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2718 precursor RNA is designated SEQ ID:2728, and is provided hereinbelow with reference to the sequence listing part.

[37984] VGAM2718 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2718 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37985] An enzyme complex designated DICER COMPLEX, dices the VGAM2718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2718 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2718 RNA is designated SEQ ID:5798, and is provided hereinbelow with reference to the sequence listing part.

[37986] VGAM2718 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2718 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2718 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[37987] VGAM2718 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2718 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2718 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2718 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2718 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[37988] The complementary binding of VGAM2718 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2718 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2718 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2718 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[37989] It is appreciated that VGAM2718 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2718 host target genes. The mRNA of each one of this plurality of VGAM2718 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2718 RNA, herein designated VGAM RNA, and which when bound by VGAM2718 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2718 host target proteins.

[37990] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2718 gene, herein designated VGAM GENE, on one or more VGAM2718 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[37991] It is yet further appreciated that a function of VGAM2718 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2718 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2718 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2718 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[37992] Nucleotide sequences of the VGAM2718 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2718 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2718 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2718 are further described hereinbelow with reference to Table 1.

[37993] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2718 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[37994] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2719 (VGAM2719) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[37995] VGAM2719 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2719 was detected is described hereinabove with reference to Figs. 2-8.

[37996] VGAM2719 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2719 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[37997] VGAM2719 gene, herein designated VGAM GENE, encodes a VGAM2719 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2719 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2719 precursor RNA is designated SEQ ID:2729, and is provided hereinbelow with reference to the sequence listing part.

[37998] VGAM2719 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[37999] An enzyme complex designated DICER COMPLEX, dices the VGAM2719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2719 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2719 RNA is designated SEQ ID:5799, and is provided hereinbelow with reference to the sequence listing part.

[38000] VGAM2719 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38001] VGAM2719 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2719 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2719 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38002] The complementary binding of VGAM2719 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2719 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2719 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38003] It is appreciated that VGAM2719 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2719 host target genes. The mRNA of each one of this plurality of VGAM2719 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2719 RNA, herein designated VGAM RNA, and which when bound by VGAM2719 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2719 host target proteins.

[38004] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2719 gene, herein designated VGAM GENE, on one or more VGAM2719 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38005] It is yet further appreciated that a function of VGAM2719 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2719 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2719 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2719 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38006] Nucleotide sequences of the VGAM2719 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2719 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2719 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2719 are further described hereinbelow with reference to Table 1.

[38007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2719 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38008] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2720 (VGAM2720) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38009] VGAM2720 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2720 was detected is described hereinabove with reference to Figs. 2-8.

[38010] VGAM2720 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 86. VGAM2720 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38011] VGAM2720 gene, herein designated VGAM GENE, encodes a VGAM2720 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2720 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2720 precursor RNA is designated SEQ ID:2730, and is provided hereinbelow with reference to the sequence listing part.

[38012] VGAM2720 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38013] An enzyme complex designated DICER COMPLEX, dices the VGAM2720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2720 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2720 RNA is designated SEQ ID:5800, and is provided hereinbelow with reference to the sequence listing part.

[38014] VGAM2720 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38015] VGAM2720 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2720 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2720 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38016] The complementary binding of VGAM2720 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2720 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2720 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38017] It is appreciated that VGAM2720 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2720 host target genes. The mRNA of each one of this plurality of VGAM2720 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2720 RNA, herein designated VGAM RNA, and which when bound by VGAM2720 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2720 host target proteins.

[38018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2720 gene, herein designated VGAM GENE, on one or more VGAM2720 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38019] It is yet further appreciated that a function of VGAM2720 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2720 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 86. Specific functions, and accordingly utilities, of VGAM2720 correlate with, and may be deduced from, the identity of the host target genes which VGAM2720 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38020] Nucleotide sequences of the VGAM2720 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2720 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2720 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2720 are further described hereinbelow with reference to Table 1.

[38021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2720 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38022] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2721 (VGAM2721) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38023] VGAM2721 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2721 was detected is described hereinabove with reference to Figs. 2-8.

[38024] VGAM2721 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM2721 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38025] VGAM2721 gene, herein designated VGAM GENE, encodes a VGAM2721 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2721 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2721 precursor RNA is designated SEQ ID:2732, and is provided hereinbelow with reference to the sequence listing part.

[38026] VGAM2721 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38027] An enzyme complex designated DICER COMPLEX, dices the VGAM2721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2721 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2721 RNA is designated SEQ ID:5802, and is provided hereinbelow with reference to the sequence listing part.

[38028] VGAM2721 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38029] VGAM2721 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2721 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2721 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[38030] The complementary binding of VGAM2721 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2721 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2721 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38031] It is appreciated that VGAM2721 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2721 host target genes. The mRNA of each one of this plurality of VGAM2721 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2721 RNA, herein designated VGAM RNA, and which when bound by VGAM2721 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2721 host target proteins.

[38032] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2721 gene, herein designated VGAM GENE, on one or more VGAM2721 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38033] It is yet further appreciated that a function of VGAM2721 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2721 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM2721 correlate with, and may be deduced from, the identity of the host target genes which VGAM2721 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[38034] Nucleotide sequences of the VGAM2721 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2721 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2721 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2721 are further described hereinbelow with reference to Table 1.

[38035] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2721 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38036] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2722 (VGAM2722) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38037] VGAM2722 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2722 was detected is described hereinabove with reference to Figs. 2-8.

[38038] VGAM2722 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 6. VGAM2722 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38039] VGAM2722 gene, herein designated VGAM GENE, encodes a VGAM2722 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2722 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2722 precursor RNA is designated SEQ ID:2736, and is provided hereinbelow with reference to the sequence listing part.

[38040] VGAM2722 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38041] An enzyme complex designated DICER COMPLEX, dices the VGAM2722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2722 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2722 RNA is designated SEQ ID:5806, and is provided hereinbelow with reference to the sequence listing part.

[38042] VGAM2722 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[38043] VGAM2722 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2722 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2722 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38044] The complementary binding of VGAM2722 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2722 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2722 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38045] It is appreciated that VGAM2722 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2722 host target genes. The mRNA of each one of this plurality of VGAM2722 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2722 RNA, herein designated VGAM RNA, and which when bound by VGAM2722 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2722 host target proteins.

[38046] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2722 gene, herein designated VGAM GENE, on one

or more VGAM2722 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38047] It is yet further appreciated that a function of VGAM2722 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2722 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 6. Specific functions, and accordingly utilities, of VGAM2722 correlate with, and may be deduced from, the identity of the host target genes which VGAM2722 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38048] Nucleotide sequences of the VGAM2722 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2722 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2722 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2722 are further described hereinbelow with reference to Table 1.

[38049] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2722 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38050] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2723 (VGAM2723) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38051] VGAM2723 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2723 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[38052] VGAM2723 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot streak virus. VGAM2723 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38053] VGAM2723 gene, herein designated VGAM GENE, encodes a VGAM2723 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2723 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2723 precursor RNA is designated SEQ ID:2733, and is provided hereinbelow with reference to the sequence listing part.

[38054] VGAM2723 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38055] An enzyme complex designated DICER COMPLEX, dices the VGAM2723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2723 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2723 RNA is designated SEQ ID:5803, and is provided hereinbelow with reference to the sequence listing part.

[38056] VGAM2723 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38057] VGAM2723 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2723 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2723 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38058] The complementary binding of VGAM2723 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2723 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2723 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38059] It is appreciated that VGAM2723 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2723 host target genes. The mRNA of each one of this plurality of VGAM2723 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2723 RNA, herein designated VGAM RNA, and which when bound by VGAM2723 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2723 host target proteins.

[38060] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2723 gene, herein designated VGAM GENE, on one or more VGAM2723 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38061] It is yet further appreciated that a function of VGAM2723 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2723 include diagnosis, prevention and treatment of viral infection by Cocksfoot streak virus. Specific functions, and accordingly utilities, of VGAM2723 correlate with, and may be deduced from, the identity of the host target genes which VGAM2723 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38062] Nucleotide sequences of the VGAM2723 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2723 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2723 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2723 are further described hereinbelow with reference to Table 1.

[38063] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2723 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38064] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2724 (VGAM2724) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38065] VGAM2724 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2724 was detected is described hereinabove with reference to Figs. 2-8.

[38066] VGAM2724 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine oral papillomavirus. VGAM2724 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38067] VGAM2724 gene, herein designated VGAM GENE, encodes a VGAM2724 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2724 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2724 precursor RNA is designated SEQ ID:2737, and is provided hereinbelow with reference to the sequence listing part.

[38068] VGAM2724 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[38069] An enzyme complex designated DICER COMPLEX, dices the VGAM2724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2724 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2724 RNA is designated SEQ ID:5807, and is provided hereinbelow with reference to the sequence listing part.

[38070] VGAM2724 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38071] VGAM2724 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2724 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2724 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38072] The complementary binding of VGAM2724 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2724 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2724 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38073] It is appreciated that VGAM2724 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2724 host target genes. The mRNA of each one of this plurality of VGAM2724 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2724 RNA, herein designated VGAM RNA, and which when bound by VGAM2724 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2724 host target proteins.

[38074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2724 gene, herein designated VGAM GENE, on one or more VGAM2724 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38075] It is yet further appreciated that a function of VGAM2724 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2724 include diagnosis, prevention and treatment of viral infection by Canine oral papillomavirus. Specific functions, and accordingly utilities, of VGAM2724 correlate with, and may be deduced from, the identity of the host target genes which VGAM2724 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38076] Nucleotide sequences of the VGAM2724 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2724 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2724 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2724 are further described hereinbelow with reference to Table 1.

[38077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2724 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38078] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2725 (VGAM2725) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38079] VGAM2725 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2725 was detected is described hereinabove with reference to Figs. 2-8.

[38080] VGAM2725 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Monkeypox virus. VGAM2725 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38081] VGAM2725 gene, herein designated VGAM GENE, encodes a VGAM2725 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2725 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2725 precursor RNA is designated SEQ ID:2734, and is provided hereinbelow with reference to the sequence listing part.

[38082] VGAM2725 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38083] An enzyme complex designated DICER COMPLEX, dices the VGAM2725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2725 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2725 RNA is designated SEQ ID:5804, and is provided hereinbelow with reference to the sequence listing part.

[38084] VGAM2725 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2725 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2725 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38085] VGAM2725 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2725 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2725 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2725 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2725 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38086] The complementary binding of VGAM2725 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2725 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2725 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2725 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38087] It is appreciated that VGAM2725 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2725 host target genes. The mRNA of each one of this plurality of VGAM2725 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2725 RNA, herein designated VGAM RNA, and which when bound by VGAM2725 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2725 host target proteins.

[38088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2725 gene, herein designated VGAM GENE, on one or more VGAM2725 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38089] It is yet further appreciated that a function of VGAM2725 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2725 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2725 correlate with, and may be deduced from, the identity of the host target genes which VGAM2725 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38090] Nucleotide sequences of the VGAM2725 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2725 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2725 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2725 are further described hereinbelow with reference to Table 1.

[38091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2725 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38092] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2726 (VGAM2726) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38093] VGAM2726 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2726 was detected is described hereinabove with reference to Figs. 2-8.

[38094] VGAM2726 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus.

VGAM2726 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38095] VGAM2726 gene, herein designated VGAM GENE, encodes a VGAM2726 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2726 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2726 precursor RNA is designated SEQ ID:2735, and is provided hereinbelow with reference to the sequence listing part.

[38096] VGAM2726 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38097] An enzyme complex designated DICER COMPLEX, dices

the VGAM2726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2726 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2726 RNA is designated SEQ ID:5805, and is provided hereinbelow with reference to the sequence listing part.

[38098] VGAM2726 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2726 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2726 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38099] VGAM2726 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2726 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2726 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2726 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2726 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38100] The complementary binding of VGAM2726 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2726 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2726 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2726 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38101] It is appreciated that VGAM2726 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2726 host target genes. The mRNA of each one of this plurality of VGAM2726 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2726 RNA, herein designated VGAM RNA, and which when bound by VGAM2726 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2726 host target proteins.

[38102] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2726 gene, herein designated VGAM GENE, on one or more VGAM2726 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38103] It is yet further appreciated that a function of VGAM2726 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2726 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM2726 correlate with, and may be deduced from, the identity of the host target genes which VGAM2726 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38104] Nucleotide sequences of the VGAM2726 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2726 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2726 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2726 are further described hereinbelow with reference to Table 1.

[38105] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2726 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38106] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2727 (VGAM2727) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38107] VGAM2727 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2727 was detected is described hereinabove with reference to Figs. 2-8.

[38108] VGAM2727 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM2727 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[38109] VGAM2727 gene, herein designated VGAM GENE, encodes a VGAM2727 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2727 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2727 precursor RNA is designated SEQ ID:2738, and is provided hereinbelow with reference to the sequence listing part.

[38110] VGAM2727 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2727 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38111] An enzyme complex designated DICER COMPLEX, dices the VGAM2727 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2727 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2727 RNA is designated SEQ ID:5808, and is provided hereinbelow with reference to the sequence listing part.

[38112] VGAM2727 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2727 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2727 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38113] VGAM2727 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2727 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2727 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2727 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2727 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38114] The complementary binding of VGAM2727 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2727 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2727

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2727 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38115] It is appreciated that VGAM2727 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2727 host target genes. The mRNA of each one of this plurality of VGAM2727 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2727 RNA, herein designated VGAM RNA, and which when bound by VGAM2727 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2727 host target proteins.

[38116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2727 gene, herein designated VGAM GENE, on one or more VGAM2727 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38117] It is yet further appreciated that a function of VGAM2727 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2727 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM2727 correlate with, and may be deduced from, the identity of the host target genes which VGAM2727 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38118] Nucleotide sequences of the VGAM2727 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2727 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2727 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2727 are further described hereinbelow with reference to Table 1.

[38119] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2727 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38120] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2728 (VGAM2728) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38121] VGAM2728 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2728 was detected is described hereinabove with reference to Figs. 2-8.

[38122] VGAM2728 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM2728 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[38123] VGAM2728 gene, herein designated VGAM GENE, encodes a VGAM2728 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2728 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2728 precursor RNA is designated SEQ ID:2739, and is provided hereinbelow with reference to the sequence listing part.

[38124] VGAM2728 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38125] An enzyme complex designated DICER COMPLEX, dices the VGAM2728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2728 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2728 RNA is designated SEQ ID:5809, and is provided hereinbelow with reference to the sequence listing part.

[38126] VGAM2728 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2728 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2728 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38127] VGAM2728 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2728 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2728 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2728 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2728 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38128] The complementary binding of VGAM2728 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2728 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2728 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2728 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38129] It is appreciated that VGAM2728 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2728 host target genes. The mRNA of each one of this plurality of VGAM2728 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2728 RNA, herein designated VGAM RNA, and which when bound by VGAM2728 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2728 host target proteins.

[38130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2728 gene, herein designated VGAM GENE, on one or more VGAM2728 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38131] It is yet further appreciated that a function of VGAM2728 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2728 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM2728 correlate with, and may be deduced from, the identity of the host target genes which VGAM2728 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38132] Nucleotide sequences of the VGAM2728 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2728 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2728 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2728 are further

described hereinbelow with reference to Table 1.

[38133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2728 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38134] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2729 (VGAM2729) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38135] VGAM2729 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2729 was detected is described hereinabove with reference to Figs. 2-8.

[38136] VGAM2729 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 60. VGAM2729 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38137] VGAM2729 gene, herein designated VGAM GENE, encodes a VGAM2729 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2729 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2729 precursor RNA is designated SEQ ID:2417, and is provided hereinbelow with reference to the sequence listing part.

[38138] VGAM2729 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38139] An enzyme complex designated DICER COMPLEX, dices the VGAM2729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2729 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2729 RNA is designated SEQ ID:5487, and is provided hereinbelow with reference to the sequence listing part.

[38140] VGAM2729 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38141] VGAM2729 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2729 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2729 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38142] The complementary binding of VGAM2729 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2729 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2729 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38143] It is appreciated that VGAM2729 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2729 host target genes. The mRNA of each one of this plurality of VGAM2729 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2729 RNA, herein designated VGAM RNA, and which when bound by VGAM2729 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2729 host target proteins.

[38144] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2729 gene, herein designated VGAM GENE, on one or more VGAM2729 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38145] It is yet further appreciated that a function of VGAM2729 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2729 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 60. Specific functions, and accordingly utilities, of VGAM2729 correlate with, and may be deduced from, the identity of the host target genes which VGAM2729 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38146] Nucleotide sequences of the VGAM2729 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2729 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2729 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2729 are further described hereinbelow with reference to Table 1.

[38147] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2729 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38148] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2730 (VGAM2730) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38149] VGAM2730 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2730 was detected is described hereinabove with reference to Figs. 2-8.

[38150] VGAM2730 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM2730 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38151] VGAM2730 gene, herein designated VGAM GENE, encodes

a VGAM2730 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2730 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2730 precursor RNA is designated SEQ ID:2422, and is provided hereinbelow with reference to the sequence listing part.

[38152] VGAM2730 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38153] An enzyme complex designated DICER COMPLEX, dices the VGAM2730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2730 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2730 RNA is designated SEQ ID:5492, and is provided hereinbelow with reference to the sequence listing part.

[38154] VGAM2730 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38155] VGAM2730 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2730 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2730 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38156] The complementary binding of VGAM2730 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2730 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2730 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[38157] It is appreciated that VGAM2730 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2730 host target genes. The mRNA of each one of this plurality of VGAM2730 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2730 RNA, herein designated VGAM RNA, and which when bound by VGAM2730 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2730 host target proteins.

[38158] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2730 gene, herein designated VGAM GENE, on one or more VGAM2730 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38159] It is yet further appreciated that a function of VGAM2730 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2730 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM2730 correlate with, and may be deduced from, the identity of the host target genes which VGAM2730 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38160] Nucleotide sequences of the VGAM2730 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2730 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2730 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2730 are further described hereinbelow with reference to Table 1.

[38161] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2730 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38162] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2731 (VGAM2731) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38163] VGAM2731 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2731 was detected is described hereinabove with reference to Figs. 2-8.

[38164] VGAM2731 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM2731 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38165] VGAM2731 gene, herein designated VGAM GENE, encodes a VGAM2731 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2731 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2731 precursor RNA is designated SEQ ID:2418, and is provided hereinbelow with reference to the sequence listing part.

[38166] VGAM2731 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38167] An enzyme complex designated DICER COMPLEX, dices the VGAM2731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2731 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2731 RNA is designated SEQ ID:5488, and is provided hereinbelow with reference to the sequence listing part.

[38168] VGAM2731 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38169] VGAM2731 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2731 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2731 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38170] The complementary binding of VGAM2731 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2731 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2731 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38171] It is appreciated that VGAM2731 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2731 host target genes. The mRNA of each one of this plurality of VGAM2731 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2731 RNA, herein designated VGAM RNA, and which when bound by VGAM2731 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2731 host target proteins.

[38172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2731 gene, herein designated VGAM GENE, on one or more VGAM2731 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38173] It is yet further appreciated that a function of VGAM2731 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2731 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2731 correlate with, and may be deduced from, the identity of the host target genes which VGAM2731 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38174] Nucleotide sequences of the VGAM2731 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2731 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2731 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2731 are further described hereinbelow with reference to Table 1.

[38175] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2731 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38176] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2732 (VGAM2732) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38177] VGAM2732 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2732 was detected is described hereinabove with reference to Figs. 2-8.

[38178] VGAM2732 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM2732 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38179] VGAM2732 gene, herein designated VGAM GENE, encodes a VGAM2732 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2732 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2732 precursor RNA is designated SEQ ID:2423, and is provided hereinbelow with reference to the sequence listing part.

[38180] VGAM2732 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38181] An enzyme complex designated DICER COMPLEX, dices the VGAM2732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2732 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2732 RNA is designated SEQ ID:5493, and is provided hereinbelow with reference to the sequence listing part.

[38182] VGAM2732 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38183] VGAM2732 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2732 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2732 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38184] The complementary binding of VGAM2732 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2732 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2732 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38185] It is appreciated that VGAM2732 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2732 host target genes. The mRNA of each one of this plurality of VGAM2732 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2732 RNA, herein designated VGAM RNA, and which when bound by VGAM2732 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2732 host target proteins.

[38186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2732 gene, herein designated VGAM GENE, on one or more VGAM2732 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38187] It is yet further appreciated that a function of VGAM2732 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2732 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2732 correlate with, and may be deduced from, the identity of the host target genes which VGAM2732 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38188] Nucleotide sequences of the VGAM2732 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2732 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2732 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2732 are further described hereinbelow with reference to Table 1.

[38189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2732 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38190] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2733 (VGAM2733) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38191] VGAM2733 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2733 was detected is described hereinabove with reference to Figs. 2-8.

[38192] VGAM2733 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2733 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38193] VGAM2733 gene, herein designated VGAM GENE, encodes a VGAM2733 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2733 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2733 precursor RNA is designated SEQ ID:2434, and is provided hereinbelow with reference to the sequence listing part.

[38194] VGAM2733 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38195] An enzyme complex designated DICER COMPLEX, dices the VGAM2733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2733 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2733 RNA is designated SEQ ID:5504, and is provided hereinbelow with reference to the sequence listing part.

[38196] VGAM2733 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38197] VGAM2733 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2733 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2733 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38198] The complementary binding of VGAM2733 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2733 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2733 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38199] It is appreciated that VGAM2733 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2733 host target genes. The mRNA of each one of this plurality of VGAM2733 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2733 RNA, herein designated VGAM RNA, and which when bound by VGAM2733 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2733 host target proteins.

[38200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2733 gene, herein designated VGAM GENE, on one or more VGAM2733 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38201] It is yet further appreciated that a function of VGAM2733 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2733 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2733 correlate with, and may be deduced from, the identity of the host target genes which VGAM2733 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38202] Nucleotide sequences of the VGAM2733 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2733 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2733 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2733 are further described hereinbelow with reference to Table 1.

[38203] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2733 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38204] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2734 (VGAM2734) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38205] VGAM2734 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2734 was detected is described hereinabove with reference to Figs. 2-8.

[38206] VGAM2734 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 70. VGAM2734 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38207] VGAM2734 gene, herein designated VGAM GENE, encodes a VGAM2734 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2734 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2734 precursor RNA is designated SEQ ID:2427, and is provided hereinbelow with reference to the sequence listing part.

[38208] VGAM2734 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38209] An enzyme complex designated DICER COMPLEX, dices the VGAM2734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2734 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2734 RNA is designated SEQ ID:5497, and is provided hereinbelow with reference to the sequence listing part.

[38210] VGAM2734 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38211] VGAM2734 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2734 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2734 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38212] The complementary binding of VGAM2734 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2734 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2734 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38213] It is appreciated that VGAM2734 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2734 host target genes. The mRNA of

each one of this plurality of VGAM2734 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2734 RNA, herein designated VGAM RNA, and which when bound by VGAM2734 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2734 host target proteins.

[38214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2734 gene, herein designated VGAM GENE, on one or more VGAM2734 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[38215] It is yet further appreciated that a function of VGAM2734 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2734 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 70. Specific functions, and accordingly utilities, of VGAM2734 correlate with, and may be deduced from, the identity of the host target genes which VGAM2734 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38216] Nucleotide sequences of the VGAM2734 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2734 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2734 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2734 are further described hereinbelow with reference to Table 1.

[38217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2734 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[38218] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2735 (VGAM2735) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38219] VGAM2735 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2735 was detected is described hereinabove with reference to Figs. 2-8.

[38220] VGAM2735 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM2735 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38221] VGAM2735 gene, herein designated VGAM GENE, encodes a VGAM2735 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2735 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2735 precursor RNA is designated SEQ ID:2424, and is provided hereinbelow with reference to the sequence listing part.

[38222] VGAM2735 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38223] An enzyme complex designated DICER COMPLEX, dices the VGAM2735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2735 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2735 RNA is designated SEQ ID:5494, and

is provided hereinbelow with reference to the sequence listing part.

[38224] VGAM2735 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38225] VGAM2735 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2735 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2735 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38226] The complementary binding of VGAM2735 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2735 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2735 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38227] It is appreciated that VGAM2735 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2735 host target genes. The mRNA of each one of this plurality of VGAM2735 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2735 RNA, herein designated VGAM RNA, and which when bound by VGAM2735 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2735 host target proteins.

[38228] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2735 gene, herein designated VGAM GENE, on one or more VGAM2735 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38229] It is yet further appreciated that a function of VGAM2735 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2735 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM2735 correlate with, and may be deduced from, the identity of the host target genes which VGAM2735 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38230] Nucleotide sequences of the VGAM2735 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2735 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2735 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2735 are further described hereinbelow with reference to Table 1.

[38231] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2735 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38232] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2736 (VGAM2736) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38233] VGAM2736 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2736 was detected is described hereinabove with reference to Figs. 2-8.

[38234] VGAM2736 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Peanut bud necrosis virus. VGAM2736 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38235] VGAM2736 gene, herein designated VGAM GENE, encodes a VGAM2736 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2736 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2736 precur-

sor RNA is designated SEQ ID:2419, and is provided hereinbelow with reference to the sequence listing part.

[38236] VGAM2736 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38237] An enzyme complex designated DICER COMPLEX, dices the VGAM2736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2736 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2736 RNA is designated SEQ ID:5489, and is provided hereinbelow with reference to the sequence

listing part.

[38238] VGAM2736 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38239] VGAM2736 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2736 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2736 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38240] The complementary binding of VGAM2736 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2736 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2736 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38241] It is appreciated that VGAM2736 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2736 host target genes. The mRNA of each one of this plurality of VGAM2736 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2736 RNA, herein designated VGAM RNA, and which when bound by VGAM2736 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2736 host target proteins.

[38242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2736 gene, herein designated VGAM GENE, on one or more VGAM2736 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38243] It is yet further appreciated that a function of VGAM2736

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2736 include diagnosis, prevention and treatment of viral infection by Peanut bud necrosis virus. Specific functions, and accordingly utilities, of VGAM2736 correlate with, and may be deduced from, the identity of the host target genes which VGAM2736 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38244] Nucleotide sequences of the VGAM2736 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2736 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2736 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2736 are further described hereinbelow with reference to Table 1.

[38245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2736 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38246] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2737 (VGAM2737) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38247] VGAM2737 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2737 was detected is described hereinabove with reference to Figs. 2-8.

[38248] VGAM2737 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2737 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38249] VGAM2737 gene, herein designated VGAM GENE, encodes a VGAM2737 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2737 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2737 precursor RNA is designated SEQ ID:2420, and is provided here-

inbelow with reference to the sequence listing part.

[38250] VGAM2737 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38251] An enzyme complex designated DICER COMPLEX, dices the VGAM2737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2737 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2737 RNA is designated SEQ ID:5490, and is provided hereinbelow with reference to the sequence listing part.

[38252] VGAM2737 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38253] VGAM2737 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2737 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2737 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38254] The complementary binding of VGAM2737 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2737 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2737 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38255] It is appreciated that VGAM2737 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2737 host target genes. The mRNA of each one of this plurality of VGAM2737 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2737 RNA, herein designated VGAM RNA, and which when bound by VGAM2737 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2737 host target proteins.

[38256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2737 gene, herein designated VGAM GENE, on one or more VGAM2737 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38257] It is yet further appreciated that a function of VGAM2737 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2737 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2737 correlate with, and may be deduced from, the identity of the host target genes which VGAM2737 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38258] Nucleotide sequences of the VGAM2737 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2737 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2737 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2737 are further described hereinbelow with reference to Table 1.

[38259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2737 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38260] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2738 (VGAM2738) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38261] VGAM2738 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2738 was detected is described hereinabove with reference to Figs. 2-8.

[38262] VGAM2738 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2738 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38263] VGAM2738 gene, herein designated VGAM GENE, encodes a VGAM2738 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2738 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2738 precursor RNA is designated SEQ ID:2421, and is provided hereinbelow with reference to the sequence listing part.

[38264] VGAM2738 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38265] An enzyme complex designated DICER COMPLEX, dices the VGAM2738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2738 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2738 RNA is designated SEQ ID:5491, and is provided hereinbelow with reference to the sequence listing part.

[38266] VGAM2738 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38267] VGAM2738 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2738 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2738 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38268] The complementary binding of VGAM2738 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2738 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2738 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38269] It is appreciated that VGAM2738 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2738 host target genes. The mRNA of each one of this plurality of VGAM2738 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2738 RNA, herein designated VGAM

RNA, and which when bound by VGAM2738 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2738 host target proteins.

[38270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2738 gene, herein designated VGAM GENE, on one or more VGAM2738 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38271] It is yet further appreciated that a function of VGAM2738 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2738 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2738 correlate with, and may be deduced from, the identity of the host target genes which VGAM2738 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38272] Nucleotide sequences of the VGAM2738 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2738 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2738 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2738 are further described hereinbelow with reference to Table 1.

[38273] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2738 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38274] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2739 (VGAM2739) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38275] VGAM2739 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2739 was detected is described hereinabove with reference to Figs. 2-8.

[38276] VGAM2739 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit oral papillomavirus. VGAM2739 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38277] VGAM2739 gene, herein designated VGAM GENE, encodes a VGAM2739 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2739 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2739 precursor RNA is designated SEQ ID:2425, and is provided hereinbelow with reference to the sequence listing part.

[38278] VGAM2739 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38279] An enzyme complex designated DICER COMPLEX, dices the VGAM2739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2739 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2739 RNA is designated SEQ ID:5495, and is provided hereinbelow with reference to the sequence listing part.

[38280] VGAM2739 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2739 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2739 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38281] VGAM2739 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2739 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2739 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2739 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2739 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38282] The complementary binding of VGAM2739 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2739 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2739 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2739 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38283] It is appreciated that VGAM2739 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2739 host target genes. The mRNA of each one of this plurality of VGAM2739 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2739 RNA, herein designated VGAM RNA, and which when bound by VGAM2739 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2739 host target proteins.

[38284] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2739 gene, herein designated VGAM GENE, on one or more VGAM2739 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38285] It is yet further appreciated that a function of VGAM2739 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2739 include diagnosis, prevention and

treatment of viral infection by Rabbit oral papillomavirus. Specific functions, and accordingly utilities, of VGAM2739 correlate with, and may be deduced from, the identity of the host target genes which VGAM2739 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38286] Nucleotide sequences of the VGAM2739 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2739 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2739 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2739 are further described hereinbelow with reference to Table 1.

[38287] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2739 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38288] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2740 (VGAM2740) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38289] VGAM2740 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2740 was detected is described hereinabove with reference to Figs. 2-8.

[38290] VGAM2740 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit oral papillomavirus. VGAM2740 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38291] VGAM2740 gene, herein designated VGAM GENE, encodes a VGAM2740 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2740 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2740 precursor RNA is designated SEQ ID:2435, and is provided hereinbelow with reference to the sequence listing part.

[38292] VGAM2740 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2740 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38293] An enzyme complex designated DICER COMPLEX, dices the VGAM2740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2740 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2740 RNA is designated SEQ ID:5505, and is provided hereinbelow with reference to the sequence listing part.

[38294] VGAM2740 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2740 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2740 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38295] VGAM2740 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2740 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2740 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2740 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2740 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38296] The complementary binding of VGAM2740 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2740 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2740 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2740 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38297] It is appreciated that VGAM2740 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2740 host target genes. The mRNA of each one of this plurality of VGAM2740 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2740 RNA, herein designated VGAM RNA, and which when bound by VGAM2740 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2740 host target proteins.

[38298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2740 gene, herein designated VGAM GENE, on one or more VGAM2740 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38299] It is yet further appreciated that a function of VGAM2740 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2740 include diagnosis, prevention and treatment of viral infection by Rabbit oral papillomavirus.

Specific functions, and accordingly utilities, of VGAM2740 correlate with, and may be deduced from, the identity of the host target genes which VGAM2740 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38300] Nucleotide sequences of the VGAM2740 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2740 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2740 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2740 are further described hereinbelow with reference to Table 1.

[38301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2740 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38302] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2741 (VGAM2741) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[38303] VGAM2741 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2741 was detected is described hereinabove with reference to Figs. 2-8.

[38304] VGAM2741 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 28. VGAM2741 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38305] VGAM2741 gene, herein designated VGAM GENE, encodes a VGAM2741 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2741 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2741 precursor RNA is designated SEQ ID:2426, and is provided hereinbelow with reference to the sequence listing part.

[38306] VGAM2741 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2741 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38307] An enzyme complex designated DICER COMPLEX, dices the VGAM2741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2741 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2741 RNA is designated SEQ ID:5496, and is provided hereinbelow with reference to the sequence listing part.

[38308] VGAM2741 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2741 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2741 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38309] VGAM2741 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2741 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2741 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2741 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2741 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38310] The complementary binding of VGAM2741 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2741 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2741 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2741 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38311] It is appreciated that VGAM2741 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2741 host target genes. The mRNA of each one of this plurality of VGAM2741 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2741 RNA, herein designated VGAM RNA, and which when bound by VGAM2741 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2741 host target proteins.

[38312] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2741 gene, herein designated VGAM GENE, on one or more VGAM2741 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38313] It is yet further appreciated that a function of VGAM2741 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2741 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 28. Specific functions, and accordingly utilities, of

VGAM2741 correlate with, and may be deduced from, the identity of the host target genes which VGAM2741 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38314] Nucleotide sequences of the VGAM2741 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2741 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2741 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2741 are further described hereinbelow with reference to Table 1.

[38315] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2741 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38316] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2742 (VGAM2742) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[38317] VGAM2742 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2742 was detected is described hereinabove with reference to Figs. 2-8.

[38318] VGAM2742 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 8. VGAM2742 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38319] VGAM2742 gene, herein designated VGAM GENE, encodes a VGAM2742 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2742 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2742 precursor RNA is designated SEQ ID:2428, and is provided hereinbelow with reference to the sequence listing part.

[38320] VGAM2742 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38321] An enzyme complex designated DICER COMPLEX, dices the VGAM2742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2742 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2742 RNA is designated SEQ ID:5498, and is provided hereinbelow with reference to the sequence listing part.

[38322] VGAM2742 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38323] VGAM2742 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2742 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2742 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38324] The complementary binding of VGAM2742 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2742 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2742 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38325] It is appreciated that VGAM2742 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2742 host target genes. The mRNA of each one of this plurality of VGAM2742 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2742 RNA, herein designated VGAM RNA, and which when bound by VGAM2742 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2742 host target proteins.

[38326] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2742 gene, herein designated VGAM GENE, on one or more VGAM2742 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38327] It is yet further appreciated that a function of VGAM2742 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2742 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 8. Specific functions, and accordingly utilities, of VGAM2742 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2742 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38328] Nucleotide sequences of the VGAM2742 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2742 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2742 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2742 are further described hereinbelow with reference to Table 1.

[38329] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2742 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38330] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2743 (VGAM2743) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38331] VGAM2743 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2743 was detected is described hereinabove with reference to Figs. 2-8.

[38332] VGAM2743 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2743 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38333] VGAM2743 gene, herein designated VGAM GENE, encodes a VGAM2743 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2743 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2743 precursor RNA is designated SEQ ID:2429, and is provided hereinbelow with reference to the sequence listing part.

[38334] VGAM2743 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38335] An enzyme complex designated DICER COMPLEX, dices the VGAM2743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2743 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2743 RNA is designated SEQ ID:5499, and is provided hereinbelow with reference to the sequence listing part.

[38336] VGAM2743 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38337] VGAM2743 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2743 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2743 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38338] The complementary binding of VGAM2743 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2743 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2743 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38339] It is appreciated that VGAM2743 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2743 host target genes. The mRNA of each one of this plurality of VGAM2743 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2743 RNA, herein designated VGAM RNA, and which when bound by VGAM2743 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2743 host target proteins.

[38340] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2743 gene, herein designated VGAM GENE, on one or more VGAM2743 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38341] It is yet further appreciated that a function of VGAM2743 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2743 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2743 correlate with, and may be deduced from, the identity of the host target genes which VGAM2743 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[38342] Nucleotide sequences of the VGAM2743 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2743 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2743 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2743 are further described hereinbelow with reference to Table 1.

[38343] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2743 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38344] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2744 (VGAM2744) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38345] VGAM2744 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2744 was detected is described hereinabove with reference to Figs. 2-8.

[38346] VGAM2744 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2744 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38347] VGAM2744 gene, herein designated VGAM GENE, encodes a VGAM2744 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2744 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2744 precursor RNA is designated SEQ ID:2430, and is provided hereinbelow with reference to the sequence listing part.

[38348] VGAM2744 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38349] An enzyme complex designated DICER COMPLEX, dices the VGAM2744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2744 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2744 RNA is designated SEQ ID:5500, and is provided hereinbelow with reference to the sequence listing part.

[38350] VGAM2744 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38351] VGAM2744 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2744 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2744 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[38352] The complementary binding of VGAM2744 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2744 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2744 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38353] It is appreciated that VGAM2744 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2744 host target genes. The mRNA of each one of this plurality of VGAM2744 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2744 RNA, herein designated VGAM RNA, and which when bound by VGAM2744 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2744 host target proteins.

[38354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2744 gene, herein designated VGAM GENE, on one or more VGAM2744 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38355] It is yet further appreciated that a function of VGAM2744 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2744 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2744 correlate with, and may be deduced from, the identity of the host target genes which VGAM2744 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[38356] Nucleotide sequences of the VGAM2744 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2744 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2744 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2744 are further described hereinbelow with reference to Table 1.

[38357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2744 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38358] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2745 (VGAM2745) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38359] VGAM2745 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2745 was detected is described hereinabove with reference to Figs. 2-8.

[38360] VGAM2745 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2745 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38361] VGAM2745 gene, herein designated VGAM GENE, encodes a VGAM2745 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2745 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2745 precursor RNA is designated SEQ ID:2438, and is provided hereinbelow with reference to the sequence listing part.

[38362] VGAM2745 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38363] An enzyme complex designated DICER COMPLEX, dices the VGAM2745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2745 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2745 RNA is designated SEQ ID:5508, and is provided hereinbelow with reference to the sequence listing part.

[38364] VGAM2745 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[38365] VGAM2745 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2745 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2745 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38366] The complementary binding of VGAM2745 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2745 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2745 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38367] It is appreciated that VGAM2745 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2745 host target genes. The mRNA of each one of this plurality of VGAM2745 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2745 RNA, herein designated VGAM RNA, and which when bound by VGAM2745 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2745 host target proteins.

[38368] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2745 gene, herein designated VGAM GENE, on one

or more VGAM2745 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38369] It is yet further appreciated that a function of VGAM2745 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2745 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2745 correlate with, and may be deduced from, the identity of the host target genes which VGAM2745 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38370] Nucleotide sequences of the VGAM2745 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2745 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2745 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2745 are further described hereinbelow with reference to Table 1.

[38371] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2745 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38372] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2746 (VGAM2746) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38373] VGAM2746 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2746 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[38374] VGAM2746 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM2746 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38375] VGAM2746 gene, herein designated VGAM GENE, encodes a VGAM2746 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2746 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2746 precursor RNA is designated SEQ ID:2445, and is provided hereinbelow with reference to the sequence listing part.

[38376] VGAM2746 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38377] An enzyme complex designated DICER COMPLEX, dices the VGAM2746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2746 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2746 RNA is designated SEQ ID:5515, and is provided hereinbelow with reference to the sequence listing part.

[38378] VGAM2746 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38379] VGAM2746 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2746 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2746 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38380] The complementary binding of VGAM2746 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2746 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2746 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38381] It is appreciated that VGAM2746 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2746 host target genes. The mRNA of each one of this plurality of VGAM2746 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2746 RNA, herein designated VGAM RNA, and which when bound by VGAM2746 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2746 host target proteins.

[38382] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2746 gene, herein designated VGAM GENE, on one or more VGAM2746 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38383] It is yet further appreciated that a function of VGAM2746 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2746 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2746 correlate with, and may be deduced from, the identity of the host target genes which VGAM2746 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38384] Nucleotide sequences of the VGAM2746 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2746 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2746 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2746 are further described hereinbelow with reference to Table 1.

[38385] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2746 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38386] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2747 (VGAM2747) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38387] VGAM2747 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2747 was detected is described hereinabove with reference to Figs. 2-8.

[38388] VGAM2747 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2747 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38389] VGAM2747 gene, herein designated VGAM GENE, encodes a VGAM2747 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2747 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2747 precursor RNA is designated SEQ ID:2439, and is provided hereinbelow with reference to the sequence listing part.

[38390] VGAM2747 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[38391] An enzyme complex designated DICER COMPLEX, dices the VGAM2747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2747 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2747 RNA is designated SEQ ID:5509, and is provided hereinbelow with reference to the sequence listing part.

[38392] VGAM2747 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38393] VGAM2747 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2747 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2747 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38394] The complementary binding of VGAM2747 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2747 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2747 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38395] It is appreciated that VGAM2747 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2747 host target genes. The mRNA of each one of this plurality of VGAM2747 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2747 RNA, herein designated VGAM RNA, and which when bound by VGAM2747 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2747 host target proteins.

[38396] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2747 gene, herein designated VGAM GENE, on one or more VGAM2747 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38397] It is yet further appreciated that a function of VGAM2747 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2747 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2747 correlate with, and may be deduced from, the identity of the host target genes which VGAM2747 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38398] Nucleotide sequences of the VGAM2747 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2747 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2747 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2747 are further described hereinbelow with reference to Table 1.

[38399] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2747 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38400] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2748 (VGAM2748) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38401] VGAM2748 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2748 was detected is described hereinabove with reference to Figs. 2-8.

[38402] VGAM2748 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Potato virus A. VGAM2748 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38403] VGAM2748 gene, herein designated VGAM GENE, encodes a VGAM2748 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2748 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2748 precursor RNA is designated SEQ ID:2431, and is provided hereinbelow with reference to the sequence listing part.

[38404] VGAM2748 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38405] An enzyme complex designated DICER COMPLEX, dices the VGAM2748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2748 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2748 RNA is designated SEQ ID:5501, and is provided hereinbelow with reference to the sequence listing part.

[38406] VGAM2748 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2748 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2748 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38407] VGAM2748 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2748 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2748 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2748 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2748 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38408] The complementary binding of VGAM2748 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2748 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2748 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2748 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38409] It is appreciated that VGAM2748 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2748 host target genes. The mRNA of each one of this plurality of VGAM2748 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2748 RNA, herein designated VGAM RNA, and which when bound by VGAM2748 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2748 host target proteins.

[38410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2748 gene, herein designated VGAM GENE, on one or more VGAM2748 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38411] It is yet further appreciated that a function of VGAM2748 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2748 include diagnosis, prevention and treatment of viral infection by Potato virus A. Specific functions, and accordingly utilities, of VGAM2748 correlate with, and may be deduced from, the identity of the host target genes which VGAM2748 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38412] Nucleotide sequences of the VGAM2748 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2748 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2748 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2748 are further described hereinbelow with reference to Table 1.

[38413] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2748 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38414] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2749 (VGAM2749) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38415] VGAM2749 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2749 was detected is described hereinabove with reference to Figs. 2-8.

[38416] VGAM2749 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus.

VGAM2749 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38417] VGAM2749 gene, herein designated VGAM GENE, encodes a VGAM2749 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2749 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2749 precursor RNA is designated SEQ ID:2440, and is provided hereinbelow with reference to the sequence listing part.

[38418] VGAM2749 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38419] An enzyme complex designated DICER COMPLEX, dices

the VGAM2749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2749 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2749 RNA is designated SEQ ID:5510, and is provided hereinbelow with reference to the sequence listing part.

[38420] VGAM2749 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2749 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2749 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38421] VGAM2749 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2749 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2749 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2749 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2749 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38422] The complementary binding of VGAM2749 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2749 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2749 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2749 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38423] It is appreciated that VGAM2749 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2749 host target genes. The mRNA of each one of this plurality of VGAM2749 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2749 RNA, herein designated VGAM RNA, and which when bound by VGAM2749 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2749 host target proteins.

[38424] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2749 gene, herein designated VGAM GENE, on one or more VGAM2749 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38425] It is yet further appreciated that a function of VGAM2749 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2749 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2749 correlate with, and may be deduced from, the identity of the host target genes which VGAM2749 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38426] Nucleotide sequences of the VGAM2749 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2749 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2749 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2749 are further described hereinbelow with reference to Table 1.

[38427] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2749 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38428] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2750 (VGAM2750) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38429] VGAM2750 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2750 was detected is described hereinabove with reference to Figs. 2-8.

[38430] VGAM2750 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2750 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[38431] VGAM2750 gene, herein designated VGAM GENE, encodes a VGAM2750 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2750 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2750 precursor RNA is designated SEQ ID:2432, and is provided hereinbelow with reference to the sequence listing part.

[38432] VGAM2750 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2750 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38433] An enzyme complex designated DICER COMPLEX, dices the VGAM2750 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2750 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2750 RNA is designated SEQ ID:5502, and is provided hereinbelow with reference to the sequence listing part.

[38434] VGAM2750 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2750 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2750 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38435] VGAM2750 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2750 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2750 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2750 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2750 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38436] The complementary binding of VGAM2750 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2750 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2750

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2750 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38437] It is appreciated that VGAM2750 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2750 host target genes. The mRNA of each one of this plurality of VGAM2750 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2750 RNA, herein designated VGAM RNA, and which when bound by VGAM2750 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2750 host target proteins.

[38438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2750 gene, herein designated VGAM GENE, on one or more VGAM2750 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38439] It is yet further appreciated that a function of VGAM2750 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2750 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2750 correlate with, and may be deduced from, the identity of the host target genes which VGAM2750 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38440] Nucleotide sequences of the VGAM2750 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2750 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2750 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2750 are further described hereinbelow with reference to Table 1.

[38441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2750 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38442] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2751 (VGAM2751) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38443] VGAM2751 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2751 was detected is described hereinabove with reference to Figs. 2-8.

[38444] VGAM2751 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM2751 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[38445] VGAM2751 gene, herein designated VGAM GENE, encodes a VGAM2751 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2751 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2751 precursor RNA is designated SEQ ID:2436, and is provided hereinbelow with reference to the sequence listing part.

[38446] VGAM2751 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38447] An enzyme complex designated DICER COMPLEX, dices the VGAM2751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2751 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2751 RNA is designated SEQ ID:5506, and is provided hereinbelow with reference to the sequence listing part.

[38448] VGAM2751 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2751 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2751 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38449] VGAM2751 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2751 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2751 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2751 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2751 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38450] The complementary binding of VGAM2751 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2751 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2751 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2751 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38451] It is appreciated that VGAM2751 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2751 host target genes. The mRNA of each one of this plurality of VGAM2751 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2751 RNA, herein designated VGAM RNA, and which when bound by VGAM2751 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2751 host target proteins.

[38452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2751 gene, herein designated VGAM GENE, on one or more VGAM2751 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38453] It is yet further appreciated that a function of VGAM2751 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2751 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2751 correlate with, and may be deduced from, the identity of the host target genes which VGAM2751 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38454] Nucleotide sequences of the VGAM2751 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2751 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2751 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2751 are further

described hereinbelow with reference to Table 1.

[38455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2751 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38456] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2752 (VGAM2752) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38457] VGAM2752 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2752 was detected is described hereinabove with reference to Figs. 2-8.

[38458] VGAM2752 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Influenza A virus. VGAM2752 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38459] VGAM2752 gene, herein designated VGAM GENE, encodes a VGAM2752 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2752 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2752 precursor RNA is designated SEQ ID:2433, and is provided hereinbelow with reference to the sequence listing part.

[38460] VGAM2752 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38461] An enzyme complex designated DICER COMPLEX, dices the VGAM2752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2752 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2752 RNA is designated SEQ ID:5503, and is provided hereinbelow with reference to the sequence listing part.

[38462] VGAM2752 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38463] VGAM2752 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2752 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2752 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38464] The complementary binding of VGAM2752 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2752 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2752 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38465] It is appreciated that VGAM2752 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2752 host target genes. The mRNA of each one of this plurality of VGAM2752 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2752 RNA, herein designated VGAM RNA, and which when bound by VGAM2752 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2752 host target proteins.

[38466] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2752 gene, herein designated VGAM GENE, on one or more VGAM2752 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38467] It is yet further appreciated that a function of VGAM2752 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2752 include diagnosis, prevention and treatment of viral infection by Influenza A virus. Specific functions, and accordingly utilities, of VGAM2752 correlate with, and may be deduced from, the identity of the host target genes which VGAM2752 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38468] Nucleotide sequences of the VGAM2752 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2752 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2752 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2752 are further described hereinbelow with reference to Table 1.

[38469] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2752 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38470] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2753 (VGAM2753) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38471] VGAM2753 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2753 was detected is described hereinabove with reference to Figs. 2-8.

[38472] VGAM2753 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 10. VGAM2753 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38473] VGAM2753 gene, herein designated VGAM GENE, encodes

a VGAM2753 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2753 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2753 precursor RNA is designated SEQ ID:2437, and is provided hereinbelow with reference to the sequence listing part.

[38474] VGAM2753 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38475] An enzyme complex designated DICER COMPLEX, dices the VGAM2753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2753 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2753 RNA is designated SEQ ID:5507, and is provided hereinbelow with reference to the sequence listing part.

[38476] VGAM2753 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38477] VGAM2753 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2753 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2753 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38478] The complementary binding of VGAM2753 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2753 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2753 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[38479] It is appreciated that VGAM2753 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2753 host target genes. The mRNA of each one of this plurality of VGAM2753 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2753 RNA, herein designated VGAM RNA, and which when bound by VGAM2753 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2753 host target proteins.

[38480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2753 gene, herein designated VGAM GENE, on one or more VGAM2753 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38481] It is yet further appreciated that a function of VGAM2753 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2753 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 10. Specific functions, and accordingly utilities, of VGAM2753 correlate with, and may be deduced from, the identity of the host target genes which VGAM2753 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38482] Nucleotide sequences of the VGAM2753 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2753 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2753 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2753 are further described hereinbelow with reference to Table 1.

[38483] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2753 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38484] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2754 (VGAM2754) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38485] VGAM2754 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2754 was detected is described hereinabove with reference to Figs. 2-8.

[38486] VGAM2754 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine fanleaf virus. VGAM2754 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38487] VGAM2754 gene, herein designated VGAM GENE, encodes a VGAM2754 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2754 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2754 precursor RNA is designated SEQ ID:2441, and is provided hereinbelow with reference to the sequence listing part.

[38488] VGAM2754 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38489] An enzyme complex designated DICER COMPLEX, dices the VGAM2754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2754 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2754 RNA is designated SEQ ID:5511, and is provided hereinbelow with reference to the sequence listing part.

[38490] VGAM2754 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38491] VGAM2754 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2754 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2754 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38492] The complementary binding of VGAM2754 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2754 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2754 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38493] It is appreciated that VGAM2754 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2754 host target genes. The mRNA of each one of this plurality of VGAM2754 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2754 RNA, herein designated VGAM RNA, and which when bound by VGAM2754 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2754 host target proteins.

[38494] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2754 gene, herein designated VGAM GENE, on one or more VGAM2754 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38495] It is yet further appreciated that a function of VGAM2754 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2754 include diagnosis, prevention and treatment of viral infection by Grapevine fanleaf virus. Specific functions, and accordingly utilities, of VGAM2754 correlate with, and may be deduced from, the identity of the host target genes which VGAM2754 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38496] Nucleotide sequences of the VGAM2754 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2754 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2754 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2754 are further described hereinbelow with reference to Table 1.

[38497] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2754 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38498] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2755 (VGAM2755) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38499] VGAM2755 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2755 was detected is described hereinabove with reference to Figs. 2-8.

[38500] VGAM2755 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM2755 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38501] VGAM2755 gene, herein designated VGAM GENE, encodes a VGAM2755 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2755 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2755 precursor RNA is designated SEQ ID:2442, and is provided hereinbelow with reference to the sequence listing part.

[38502] VGAM2755 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38503] An enzyme complex designated DICER COMPLEX, dices the VGAM2755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2755 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2755 RNA is designated SEQ ID:5512, and is provided hereinbelow with reference to the sequence listing part.

[38504] VGAM2755 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38505] VGAM2755 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2755 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2755 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38506] The complementary binding of VGAM2755 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2755 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2755 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38507] It is appreciated that VGAM2755 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2755 host target genes. The mRNA of each one of this plurality of VGAM2755 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2755 RNA, herein designated VGAM RNA, and which when bound by VGAM2755 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2755 host target proteins.

[38508] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2755 gene, herein designated VGAM GENE, on one or more VGAM2755 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38509] It is yet further appreciated that a function of VGAM2755 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2755 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM2755 correlate with, and may be deduced from, the identity of the host target genes which VGAM2755 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38510] Nucleotide sequences of the VGAM2755 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2755 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2755 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2755 are further described hereinbelow with reference to Table 1.

[38511] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2755 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38512] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2756 (VGAM2756) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38513] VGAM2756 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2756 was detected is described hereinabove with reference to Figs. 2-8.

[38514] VGAM2756 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean common mosaic necrosis virus. VGAM2756 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38515] VGAM2756 gene, herein designated VGAM GENE, encodes a VGAM2756 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2756 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2756 precursor RNA is designated SEQ ID:2446, and is provided hereinbelow with reference to the sequence listing part.

[38516] VGAM2756 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38517] An enzyme complex designated DICER COMPLEX, dices the VGAM2756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2756 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2756 RNA is designated SEQ ID:5516, and is provided hereinbelow with reference to the sequence listing part.

[38518] VGAM2756 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38519] VGAM2756 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2756 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2756 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38520] The complementary binding of VGAM2756 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2756 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2756 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38521] It is appreciated that VGAM2756 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2756 host target genes. The mRNA of each one of this plurality of VGAM2756 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2756 RNA, herein designated VGAM RNA, and which when bound by VGAM2756 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2756 host target proteins.

[38522] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2756 gene, herein designated VGAM GENE, on one or more VGAM2756 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38523] It is yet further appreciated that a function of VGAM2756 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2756 include diagnosis, prevention and treatment of viral infection by Bean common mosaic necrosis virus. Specific functions, and accordingly utilities, of VGAM2756 correlate with, and may be deduced from, the identity of the host target genes which VGAM2756 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38524] Nucleotide sequences of the VGAM2756 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2756 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2756 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2756 are further described hereinbelow with reference to Table 1.

[38525] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2756 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38526] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2757 (VGAM2757) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38527] VGAM2757 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2757 was detected is described hereinabove with reference to Figs. 2-8.

[38528] VGAM2757 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM2757 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38529] VGAM2757 gene, herein designated VGAM GENE, encodes a VGAM2757 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2757 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2757 precursor RNA is designated SEQ ID:2447, and is provided hereinbelow with reference to the sequence listing part.

[38530] VGAM2757 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38531] An enzyme complex designated DICER COMPLEX, dices the VGAM2757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2757 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2757 RNA is designated SEQ ID:5517, and is provided hereinbelow with reference to the sequence listing part.

[38532] VGAM2757 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38533] VGAM2757 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2757 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2757 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38534] The complementary binding of VGAM2757 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2757 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2757 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38535] It is appreciated that VGAM2757 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2757 host target genes. The mRNA of

each one of this plurality of VGAM2757 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2757 RNA, herein designated VGAM RNA, and which when bound by VGAM2757 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2757 host target proteins.

[38536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2757 gene, herein designated VGAM GENE, on one or more VGAM2757 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[38537] It is yet further appreciated that a function of VGAM2757 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2757 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM2757 correlate with, and may be deduced from, the identity of the host target genes which VGAM2757 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38538] Nucleotide sequences of the VGAM2757 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2757 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2757 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2757 are further described hereinbelow with reference to Table 1.

[38539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2757 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[38540] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2758 (VGAM2758) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38541] VGAM2758 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2758 was detected is described hereinabove with reference to Figs. 2-8.

[38542] VGAM2758 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2758 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38543] VGAM2758 gene, herein designated VGAM GENE, encodes a VGAM2758 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2758 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2758 precursor RNA is designated SEQ ID:2443, and is provided hereinbelow with reference to the sequence listing part.

[38544] VGAM2758 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38545] An enzyme complex designated DICER COMPLEX, dices the VGAM2758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2758 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2758 RNA is designated SEQ ID:5513, and

is provided hereinbelow with reference to the sequence listing part.

[38546] VGAM2758 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38547] VGAM2758 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2758 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2758 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38548] The complementary binding of VGAM2758 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2758 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2758 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38549] It is appreciated that VGAM2758 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2758 host target genes. The mRNA of each one of this plurality of VGAM2758 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2758 RNA, herein designated VGAM RNA, and which when bound by VGAM2758 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2758 host target proteins.

[38550] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2758 gene, herein designated VGAM GENE, on one or more VGAM2758 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38551] It is yet further appreciated that a function of VGAM2758 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2758 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2758 correlate with, and may be deduced from, the identity of the host target genes which VGAM2758 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38552] Nucleotide sequences of the VGAM2758 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2758 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2758 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2758 are further described hereinbelow with reference to Table 1.

[38553] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2758 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38554] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2759 (VGAM2759) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38555] VGAM2759 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2759 was detected is described hereinabove with reference to Figs. 2-8.

[38556] VGAM2759 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2759 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38557] VGAM2759 gene, herein designated VGAM GENE, encodes a VGAM2759 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2759 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2759 precur-

sor RNA is designated SEQ ID:2452, and is provided hereinbelow with reference to the sequence listing part.

[38558] VGAM2759 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38559] An enzyme complex designated DICER COMPLEX, dices the VGAM2759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2759 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2759 RNA is designated SEQ ID:5522, and is provided hereinbelow with reference to the sequence

listing part.

[38560] VGAM2759 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38561] VGAM2759 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2759 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2759 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38562] The complementary binding of VGAM2759 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2759 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2759 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38563] It is appreciated that VGAM2759 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2759 host target genes. The mRNA of each one of this plurality of VGAM2759 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2759 RNA, herein designated VGAM RNA, and which when bound by VGAM2759 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2759 host target proteins.

[38564] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2759 gene, herein designated VGAM GENE, on one or more VGAM2759 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38565] It is yet further appreciated that a function of VGAM2759

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2759 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2759 correlate with, and may be deduced from, the identity of the host target genes which VGAM2759 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38566] Nucleotide sequences of the VGAM2759 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2759 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2759 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2759 are further described hereinbelow with reference to Table 1.

[38567] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2759 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38568] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2760 (VGAM2760) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38569] VGAM2760 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2760 was detected is described hereinabove with reference to Figs. 2-8.

[38570] VGAM2760 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia virus. VGAM2760 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38571] VGAM2760 gene, herein designated VGAM GENE, encodes a VGAM2760 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2760 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2760 precursor RNA is designated SEQ ID:2444, and is provided here-

inbelow with reference to the sequence listing part.

[38572] VGAM2760 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38573] An enzyme complex designated DICER COMPLEX, dices the VGAM2760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2760 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2760 RNA is designated SEQ ID:5514, and is provided hereinbelow with reference to the sequence listing part.

[38574] VGAM2760 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38575] VGAM2760 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2760 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2760 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38576] The complementary binding of VGAM2760 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2760 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2760 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38577] It is appreciated that VGAM2760 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2760 host target genes. The mRNA of each one of this plurality of VGAM2760 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2760 RNA, herein designated VGAM RNA, and which when bound by VGAM2760 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2760 host target proteins.

[38578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2760 gene, herein designated VGAM GENE, on one or more VGAM2760 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38579] It is yet further appreciated that a function of VGAM2760 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2760 include diagnosis, prevention and treatment of viral infection by Ectromelia virus. Specific functions, and accordingly utilities, of VGAM2760 correlate with, and may be deduced from, the identity of the host target genes which VGAM2760 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38580] Nucleotide sequences of the VGAM2760 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2760 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2760 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2760 are further described hereinbelow with reference to Table 1.

[38581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2760 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38582] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2761 (VGAM2761) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38583] VGAM2761 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2761 was detected is described hereinabove with reference to Figs. 2-8.

[38584] VGAM2761 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 2. VGAM2761 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38585] VGAM2761 gene, herein designated VGAM GENE, encodes a VGAM2761 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2761 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2761 precursor RNA is designated SEQ ID:2448, and is provided hereinbelow with reference to the sequence listing part.

[38586] VGAM2761 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38587] An enzyme complex designated DICER COMPLEX, dices the VGAM2761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2761 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2761 RNA is designated SEQ ID:5518, and is provided hereinbelow with reference to the sequence listing part.

[38588] VGAM2761 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38589] VGAM2761 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2761 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2761 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38590] The complementary binding of VGAM2761 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2761 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2761 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38591] It is appreciated that VGAM2761 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2761 host target genes. The mRNA of each one of this plurality of VGAM2761 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2761 RNA, herein designated VGAM

RNA, and which when bound by VGAM2761 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2761 host target proteins.

[38592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2761 gene, herein designated VGAM GENE, on one or more VGAM2761 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38593] It is yet further appreciated that a function of VGAM2761 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2761 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2761 correlate with, and may be deduced from, the identity of the host target genes which VGAM2761 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38594] Nucleotide sequences of the VGAM2761 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2761 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2761 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2761 are further described hereinbelow with reference to Table 1.

[38595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2761 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38596] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2762 (VGAM2762) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38597] VGAM2762 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2762 was detected is described hereinabove with reference to Figs. 2-8.

[38598] VGAM2762 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 50. VGAM2762 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38599] VGAM2762 gene, herein designated VGAM GENE, encodes a VGAM2762 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2762 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2762 precursor RNA is designated SEQ ID:2449, and is provided hereinbelow with reference to the sequence listing part.

[38600] VGAM2762 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38601] An enzyme complex designated DICER COMPLEX, dices the VGAM2762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2762 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2762 RNA is designated SEQ ID:5519, and is provided hereinbelow with reference to the sequence listing part.

[38602] VGAM2762 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2762 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2762 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38603] VGAM2762 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2762 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2762 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2762 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2762 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38604] The complementary binding of VGAM2762 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2762 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2762 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2762 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38605] It is appreciated that VGAM2762 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2762 host target genes. The mRNA of each one of this plurality of VGAM2762 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2762 RNA, herein designated VGAM RNA, and which when bound by VGAM2762 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2762 host target proteins.

[38606] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2762 gene, herein designated VGAM GENE, on one or more VGAM2762 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38607] It is yet further appreciated that a function of VGAM2762 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2762 include diagnosis, prevention and

treatment of viral infection by Human papillomavirus type 50. Specific functions, and accordingly utilities, of VGAM2762 correlate with, and may be deduced from, the identity of the host target genes which VGAM2762 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38608] Nucleotide sequences of the VGAM2762 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2762 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2762 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2762 are further described hereinbelow with reference to Table 1.

[38609] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2762 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38610] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2763 (VGAM2763) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38611] VGAM2763 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2763 was detected is described hereinabove with reference to Figs. 2-8.

[38612] VGAM2763 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Frog adenovirus 1. VGAM2763 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38613] VGAM2763 gene, herein designated VGAM GENE, encodes a VGAM2763 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2763 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2763 precursor RNA is designated SEQ ID:2453, and is provided hereinbelow with reference to the sequence listing part.

[38614] VGAM2763 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2763 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38615] An enzyme complex designated DICER COMPLEX, dices the VGAM2763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2763 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2763 RNA is designated SEQ ID:5523, and is provided hereinbelow with reference to the sequence listing part.

[38616] VGAM2763 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2763 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2763 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38617] VGAM2763 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2763 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2763 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2763 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2763 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38618] The complementary binding of VGAM2763 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2763 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2763 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2763 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38619] It is appreciated that VGAM2763 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2763 host target genes. The mRNA of each one of this plurality of VGAM2763 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2763 RNA, herein designated VGAM RNA, and which when bound by VGAM2763 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2763 host target proteins.

[38620] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2763 gene, herein designated VGAM GENE, on one or more VGAM2763 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38621] It is yet further appreciated that a function of VGAM2763 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2763 include diagnosis, prevention and treatment of viral infection by Frog adenovirus 1. Specific

functions, and accordingly utilities, of VGAM2763 correlate with, and may be deduced from, the identity of the host target genes which VGAM2763 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38622] Nucleotide sequences of the VGAM2763 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2763 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2763 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2763 are further described hereinbelow with reference to Table 1.

[38623] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2763 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38624] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2764 (VGAM2764) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[38625] VGAM2764 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2764 was detected is described hereinabove with reference to Figs. 2-8.

[38626] VGAM2764 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2764 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38627] VGAM2764 gene, herein designated VGAM GENE, encodes a VGAM2764 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2764 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2764 precursor RNA is designated SEQ ID:2454, and is provided hereinbelow with reference to the sequence listing part.

[38628] VGAM2764 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2764 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38629] An enzyme complex designated DICER COMPLEX, dices the VGAM2764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2764 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2764 RNA is designated SEQ ID:5524, and is provided hereinbelow with reference to the sequence listing part.

[38630] VGAM2764 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2764 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2764 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38631] VGAM2764 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2764 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2764 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2764 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2764 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38632] The complementary binding of VGAM2764 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2764 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2764 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2764 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38633] It is appreciated that VGAM2764 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2764 host target genes. The mRNA of each one of this plurality of VGAM2764 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2764 RNA, herein designated VGAM RNA, and which when bound by VGAM2764 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2764 host target proteins.

[38634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2764 gene, herein designated VGAM GENE, on one or more VGAM2764 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38635] It is yet further appreciated that a function of VGAM2764 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2764 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2764 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2764 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38636] Nucleotide sequences of the VGAM2764 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2764 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2764 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2764 are further described hereinbelow with reference to Table 1.

[38637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2764 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38638] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2765 (VGAM2765) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[38639] VGAM2765 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2765 was detected is described hereinabove with reference to Figs. 2-8.

[38640] VGAM2765 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM2765 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38641] VGAM2765 gene, herein designated VGAM GENE, encodes a VGAM2765 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2765 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2765 precursor RNA is designated SEQ ID:2455, and is provided hereinbelow with reference to the sequence listing part.

[38642] VGAM2765 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38643] An enzyme complex designated DICER COMPLEX, dices the VGAM2765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2765 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2765 RNA is designated SEQ ID:5525, and is provided hereinbelow with reference to the sequence listing part.

[38644] VGAM2765 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38645] VGAM2765 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2765 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2765 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38646] The complementary binding of VGAM2765 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2765 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2765 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38647] It is appreciated that VGAM2765 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2765 host target genes. The mRNA of each one of this plurality of VGAM2765 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2765 RNA, herein designated VGAM RNA, and which when bound by VGAM2765 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2765 host target proteins.

[38648] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2765 gene, herein designated VGAM GENE, on one or more VGAM2765 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38649] It is yet further appreciated that a function of VGAM2765 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2765 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM2765 correlate with, and may be deduced from, the

identity of the host target genes which VGAM2765 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38650] Nucleotide sequences of the VGAM2765 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2765 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2765 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2765 are further described hereinbelow with reference to Table 1.

[38651] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2765 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38652] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2766 (VGAM2766) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38653] VGAM2766 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2766 was detected is described hereinabove with reference to Figs. 2-8.

[38654] VGAM2766 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM2766 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38655] VGAM2766 gene, herein designated VGAM GENE, encodes a VGAM2766 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2766 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2766 precursor RNA is designated SEQ ID:2456, and is provided hereinbelow with reference to the sequence listing part.

[38656] VGAM2766 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38657] An enzyme complex designated DICER COMPLEX, dices the VGAM2766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2766 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2766 RNA is designated SEQ ID:5526, and is provided hereinbelow with reference to the sequence listing part.

[38658] VGAM2766 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38659] VGAM2766 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2766 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2766 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38660] The complementary binding of VGAM2766 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2766 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2766 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38661] It is appreciated that VGAM2766 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2766 host target genes. The mRNA of each one of this plurality of VGAM2766 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2766 RNA, herein designated VGAM RNA, and which when bound by VGAM2766 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2766 host target proteins.

[38662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2766 gene, herein designated VGAM GENE, on one or more VGAM2766 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38663] It is yet further appreciated that a function of VGAM2766 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2766 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2766 correlate with, and may be deduced from, the identity of the host target genes which VGAM2766

binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38664] Nucleotide sequences of the VGAM2766 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2766 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2766 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2766 are further described hereinbelow with reference to Table 1.

[38665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2766 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38666] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2767 (VGAM2767) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38667] VGAM2767 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2767 was detected is described hereinabove with reference to Figs. 2-8.

[38668] VGAM2767 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 48. VGAM2767 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38669] VGAM2767 gene, herein designated VGAM GENE, encodes a VGAM2767 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2767 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2767 precursor RNA is designated SEQ ID:2450, and is provided hereinbelow with reference to the sequence listing part.

[38670] VGAM2767 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38671] An enzyme complex designated DICER COMPLEX, dices the VGAM2767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2767 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2767 RNA is designated SEQ ID:5520, and is provided hereinbelow with reference to the sequence listing part.

[38672] VGAM2767 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38673] VGAM2767 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2767 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2767 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[38674] The complementary binding of VGAM2767 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2767 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2767 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38675] It is appreciated that VGAM2767 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2767 host target genes. The mRNA of each one of this plurality of VGAM2767 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2767 RNA, herein designated VGAM RNA, and which when bound by VGAM2767 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2767 host target proteins.

[38676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2767 gene, herein designated VGAM GENE, on one or more VGAM2767 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38677] It is yet further appreciated that a function of VGAM2767 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2767 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 48. Specific functions, and accordingly utilities, of VGAM2767 correlate with, and may be deduced from, the identity of the host target genes which VGAM2767 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[38678] Nucleotide sequences of the VGAM2767 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2767 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2767 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2767 are further described hereinbelow with reference to Table 1.

[38679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2767 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38680] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2768 (VGAM2768) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38681] VGAM2768 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2768 was detected is described hereinabove with reference to Figs. 2-8.

[38682] VGAM2768 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM2768 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38683] VGAM2768 gene, herein designated VGAM GENE, encodes a VGAM2768 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2768 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2768 precursor RNA is designated SEQ ID:2457, and is provided hereinbelow with reference to the sequence listing part.

[38684] VGAM2768 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38685] An enzyme complex designated DICER COMPLEX, dices the VGAM2768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2768 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2768 RNA is designated SEQ ID:5527, and is provided hereinbelow with reference to the sequence listing part.

[38686] VGAM2768 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[38687] VGAM2768 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2768 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2768 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38688] The complementary binding of VGAM2768 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2768 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2768 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38689] It is appreciated that VGAM2768 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2768 host target genes. The mRNA of each one of this plurality of VGAM2768 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2768 RNA, herein designated VGAM RNA, and which when bound by VGAM2768 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2768 host target proteins.

[38690] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2768 gene, herein designated VGAM GENE, on one

or more VGAM2768 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38691] It is yet further appreciated that a function of VGAM2768 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2768 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2768 correlate with, and may be deduced from, the identity of the host target genes which VGAM2768 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38692] Nucleotide sequences of the VGAM2768 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2768 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2768 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2768 are further described hereinbelow with reference to Table 1.

[38693] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2768 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38694] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2769 (VGAM2769) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38695] VGAM2769 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2769 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[38696] VGAM2769 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2769 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38697] VGAM2769 gene, herein designated VGAM GENE, encodes a VGAM2769 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2769 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2769 precursor RNA is designated SEQ ID:2451, and is provided hereinbelow with reference to the sequence listing part.

[38698] VGAM2769 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38699] An enzyme complex designated DICER COMPLEX, dices the VGAM2769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2769 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2769 RNA is designated SEQ ID:5521, and is provided hereinbelow with reference to the sequence listing part.

[38700] VGAM2769 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38701] VGAM2769 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2769 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2769 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38702] The complementary binding of VGAM2769 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2769 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2769 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38703] It is appreciated that VGAM2769 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2769 host target genes. The mRNA of each one of this plurality of VGAM2769 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2769 RNA, herein designated VGAM RNA, and which when bound by VGAM2769 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2769 host target proteins.

[38704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2769 gene, herein designated VGAM GENE, on one or more VGAM2769 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38705] It is yet further appreciated that a function of VGAM2769 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2769 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2769 correlate with, and may be deduced from, the identity of the host target genes which VGAM2769 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38706] Nucleotide sequences of the VGAM2769 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2769 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2769 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2769 are further described hereinbelow with reference to Table 1.

[38707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2769 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38708] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2770 (VGAM2770) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38709] VGAM2770 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2770 was detected is described hereinabove with reference to Figs. 2-8.

[38710] VGAM2770 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM2770 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38711] VGAM2770 gene, herein designated VGAM GENE, encodes a VGAM2770 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2770 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2770 precursor RNA is designated SEQ ID:2458, and is provided hereinbelow with reference to the sequence listing part.

[38712] VGAM2770 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[38713] An enzyme complex designated DICER COMPLEX, dices the VGAM2770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2770 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2770 RNA is designated SEQ ID:5528, and is provided hereinbelow with reference to the sequence listing part.

[38714] VGAM2770 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38715] VGAM2770 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2770 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2770 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38716] The complementary binding of VGAM2770 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2770 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2770 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38717] It is appreciated that VGAM2770 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2770 host target genes. The mRNA of each one of this plurality of VGAM2770 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2770 RNA, herein designated VGAM RNA, and which when bound by VGAM2770 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2770 host target proteins.

[38718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2770 gene, herein designated VGAM GENE, on one or more VGAM2770 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38719] It is yet further appreciated that a function of VGAM2770 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2770 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM2770 correlate with, and may be deduced from, the identity of the host target genes which VGAM2770 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38720] Nucleotide sequences of the VGAM2770 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2770 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2770 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2770 are further described hereinbelow with reference to Table 1.

[38721] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2770 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38722] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2771 (VGAM2771) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38723] VGAM2771 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2771 was detected is described hereinabove with reference to Figs. 2-8.

[38724] VGAM2771 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 7. VGAM2771 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38725] VGAM2771 gene, herein designated VGAM GENE, encodes a VGAM2771 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2771 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2771 precursor RNA is designated SEQ ID:2459, and is provided hereinbelow with reference to the sequence listing part.

[38726] VGAM2771 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38727] An enzyme complex designated DICER COMPLEX, dices the VGAM2771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2771 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2771 RNA is designated SEQ ID:5529, and is provided hereinbelow with reference to the sequence listing part.

[38728] VGAM2771 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2771 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2771 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38729] VGAM2771 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2771 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2771 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2771 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2771 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38730] The complementary binding of VGAM2771 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2771 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2771 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2771 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38731] It is appreciated that VGAM2771 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2771 host target genes. The mRNA of each one of this plurality of VGAM2771 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2771 RNA, herein designated VGAM RNA, and which when bound by VGAM2771 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2771 host target proteins.

[38732] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2771 gene, herein designated VGAM GENE, on one or more VGAM2771 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38733] It is yet further appreciated that a function of VGAM2771 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2771 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2771 correlate with, and may be deduced from, the identity of the host target genes which VGAM2771 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38734] Nucleotide sequences of the VGAM2771 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2771 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2771 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2771 are further described hereinbelow with reference to Table 1.

[38735] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2771 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38736] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2772 (VGAM2772) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38737] VGAM2772 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2772 was detected is described hereinabove with reference to Figs. 2-8.

[38738] VGAM2772 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie

virus. VGAM2772 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38739] VGAM2772 gene, herein designated VGAM GENE, encodes a VGAM2772 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2772 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2772 precursor RNA is designated SEQ ID:2461, and is provided hereinbelow with reference to the sequence listing part.

[38740] VGAM2772 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38741] An enzyme complex designated DICER COMPLEX, dices the VGAM2772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2772 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2772 RNA is designated SEQ ID:5531, and is provided hereinbelow with reference to the sequence listing part.

[38742] VGAM2772 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2772 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2772 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38743] VGAM2772 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2772 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2772 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2772 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2772 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38744] The complementary binding of VGAM2772 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2772 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2772 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2772 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38745] It is appreciated that VGAM2772 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2772 host target genes. The mRNA of each one of this plurality of VGAM2772 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2772 RNA, herein designated VGAM RNA, and which when bound by VGAM2772 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2772 host target proteins.

[38746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2772 gene, herein designated VGAM GENE, on one or more VGAM2772 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38747] It is yet further appreciated that a function of VGAM2772 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2772 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM2772 correlate with, and may be deduced from, the identity of the host target genes which VGAM2772 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38748] Nucleotide sequences of the VGAM2772 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2772 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2772 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2772 are further described hereinbelow with reference to Table 1.

[38749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2772 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38750] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2773 (VGAM2773) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38751] VGAM2773 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2773 was detected is described hereinabove with reference to Figs. 2-8.

[38752] VGAM2773 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie

virus. VGAM2773 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38753] VGAM2773 gene, herein designated VGAM GENE, encodes a VGAM2773 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2773 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2773 precursor RNA is designated SEQ ID:2462, and is provided hereinbelow with reference to the sequence listing part.

[38754] VGAM2773 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38755] An enzyme complex designated DICER COMPLEX, dices

the VGAM2773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2773 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2773 RNA is designated SEQ ID:5532, and is provided hereinbelow with reference to the sequence listing part.

[38756] VGAM2773 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2773 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2773 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38757] VGAM2773 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2773 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2773 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2773 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2773 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38758] The complementary binding of VGAM2773 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2773 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2773 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2773 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38759] It is appreciated that VGAM2773 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2773 host target genes. The mRNA of each one of this plurality of VGAM2773 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2773 RNA, herein designated VGAM RNA, and which when bound by VGAM2773 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2773 host target proteins.

[38760] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2773 gene, herein designated VGAM GENE, on one or more VGAM2773 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38761] It is yet further appreciated that a function of VGAM2773 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2773 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM2773 correlate with, and may be deduced from, the identity of the host target genes which VGAM2773 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38762] Nucleotide sequences of the VGAM2773 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2773 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2773 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2773 are further described hereinbelow with reference to Table 1.

[38763] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2773 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38764] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2774 (VGAM2774) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38765] VGAM2774 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2774 was detected is described hereinabove with reference to Figs. 2-8.

[38766] VGAM2774 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious flacherie virus. VGAM2774 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38767] VGAM2774 gene, herein designated VGAM GENE, encodes a VGAM2774 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2774 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2774 precursor RNA is designated SEQ ID:2469, and is provided hereinbelow with reference to the sequence listing part.

[38768] VGAM2774 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2774 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38769] An enzyme complex designated DICER COMPLEX, dices the VGAM2774 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2774 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2774 RNA is designated SEQ ID:5539, and is provided hereinbelow with reference to the sequence listing part.

[38770] VGAM2774 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2774 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2774 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38771] VGAM2774 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2774 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2774 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2774 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2774 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38772] The complementary binding of VGAM2774 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2774 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2774

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2774 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38773] It is appreciated that VGAM2774 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2774 host target genes. The mRNA of each one of this plurality of VGAM2774 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2774 RNA, herein designated VGAM RNA, and which when bound by VGAM2774 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2774 host target proteins.

[38774] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2774 gene, herein designated VGAM GENE, on one or more VGAM2774 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38775] It is yet further appreciated that a function of VGAM2774 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2774 include diagnosis, prevention and treatment of viral infection by Infectious flacherie virus. Specific functions, and accordingly utilities, of VGAM2774 correlate with, and may be deduced from, the identity of the host target genes which VGAM2774 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38776] Nucleotide sequences of the VGAM2774 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2774 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2774 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2774 are further described hereinbelow with reference to Table 1.

[38777] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2774 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38778] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2775 (VGAM2775) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38779] VGAM2775 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2775 was detected is described hereinabove with reference to Figs. 2-8.

[38780] VGAM2775 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM2775 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[38781] VGAM2775 gene, herein designated VGAM GENE, encodes a VGAM2775 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2775 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2775 precursor RNA is designated SEQ ID:2460, and is provided hereinbelow with reference to the sequence listing part.

[38782] VGAM2775 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38783] An enzyme complex designated DICER COMPLEX, dices the VGAM2775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2775 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2775 RNA is designated SEQ ID:5530, and is provided hereinbelow with reference to the sequence listing part.

[38784] VGAM2775 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2775 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2775 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38785] VGAM2775 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2775 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2775 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2775 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2775 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38786] The complementary binding of VGAM2775 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2775 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2775 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2775 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38787] It is appreciated that VGAM2775 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2775 host target genes. The mRNA of each one of this plurality of VGAM2775 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2775 RNA, herein designated VGAM RNA, and which when bound by VGAM2775 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2775 host target proteins.

[38788] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2775 gene, herein designated VGAM GENE, on one or more VGAM2775 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38789] It is yet further appreciated that a function of VGAM2775 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2775 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2775 correlate with, and may be deduced from, the identity of the host target genes which VGAM2775 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38790] Nucleotide sequences of the VGAM2775 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2775 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2775 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2775 are further

described hereinbelow with reference to Table 1.

[38791] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2775 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38792] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2776 (VGAM2776) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38793] VGAM2776 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2776 was detected is described hereinabove with reference to Figs. 2-8.

[38794] VGAM2776 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM2776 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38795] VGAM2776 gene, herein designated VGAM GENE, encodes a VGAM2776 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2776 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2776 precursor RNA is designated SEQ ID:2463, and is provided hereinbelow with reference to the sequence listing part.

[38796] VGAM2776 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38797] An enzyme complex designated DICER COMPLEX, dices the VGAM2776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2776 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2776 RNA is designated SEQ ID:5533, and is provided hereinbelow with reference to the sequence listing part.

[38798] VGAM2776 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38799] VGAM2776 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2776 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2776 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38800] The complementary binding of VGAM2776 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2776 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2776 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38801] It is appreciated that VGAM2776 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2776 host target genes. The mRNA of each one of this plurality of VGAM2776 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2776 RNA, herein designated VGAM RNA, and which when bound by VGAM2776 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2776 host target proteins.

[38802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2776 gene, herein designated VGAM GENE, on one or more VGAM2776 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38803] It is yet further appreciated that a function of VGAM2776 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2776 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2776 correlate with, and may be deduced from, the identity of the host target genes which VGAM2776 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38804] Nucleotide sequences of the VGAM2776 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2776 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2776 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2776 are further described hereinbelow with reference to Table 1.

[38805] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2776 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38806] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2777 (VGAM2777) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38807] VGAM2777 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2777 was detected is described hereinabove with reference to Figs. 2-8.

[38808] VGAM2777 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum mosaic virus. VGAM2777 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38809] VGAM2777 gene, herein designated VGAM GENE, encodes

a VGAM2777 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2777 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2777 precursor RNA is designated SEQ ID:2464, and is provided hereinbelow with reference to the sequence listing part.

[38810] VGAM2777 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38811] An enzyme complex designated DICER COMPLEX, dices the VGAM2777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2777 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2777 RNA is designated SEQ ID:5534, and is provided hereinbelow with reference to the sequence listing part.

[38812] VGAM2777 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38813] VGAM2777 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2777 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2777 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38814] The complementary binding of VGAM2777 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2777 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2777 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[38815] It is appreciated that VGAM2777 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2777 host target genes. The mRNA of each one of this plurality of VGAM2777 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2777 RNA, herein designated VGAM RNA, and which when bound by VGAM2777 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2777 host target proteins.

[38816] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2777 gene, herein designated VGAM GENE, on one or more VGAM2777 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38817] It is yet further appreciated that a function of VGAM2777 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2777 include diagnosis, prevention and treatment of viral infection by Sorghum mosaic virus. Specific functions, and accordingly utilities, of VGAM2777 correlate with, and may be deduced from, the identity of the host target genes which VGAM2777 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38818] Nucleotide sequences of the VGAM2777 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2777 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2777 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2777 are further described hereinbelow with reference to Table 1.

[38819] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2777 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38820] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2778 (VGAM2778) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38821] VGAM2778 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2778 was detected is described hereinabove with reference to Figs. 2-8.

[38822] VGAM2778 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sorghum mosaic virus. VGAM2778 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38823] VGAM2778 gene, herein designated VGAM GENE, encodes a VGAM2778 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2778 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2778 precursor RNA is designated SEQ ID:2465, and is provided hereinbelow with reference to the sequence listing part.

[38824] VGAM2778 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38825] An enzyme complex designated DICER COMPLEX, dices the VGAM2778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2778 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2778 RNA is designated SEQ ID:5535, and is provided hereinbelow with reference to the sequence listing part.

[38826] VGAM2778 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38827] VGAM2778 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2778 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2778 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38828] The complementary binding of VGAM2778 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2778 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2778 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38829] It is appreciated that VGAM2778 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2778 host target genes. The mRNA of each one of this plurality of VGAM2778 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2778 RNA, herein designated VGAM RNA, and which when bound by VGAM2778 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2778 host target proteins.

[38830] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2778 gene, herein designated VGAM GENE, on one or more VGAM2778 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38831] It is yet further appreciated that a function of VGAM2778 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2778 include diagnosis, prevention and treatment of viral infection by Sorghum mosaic virus. Specific functions, and accordingly utilities, of VGAM2778 correlate with, and may be deduced from, the identity of the host target genes which VGAM2778 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38832] Nucleotide sequences of the VGAM2778 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2778 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2778 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2778 are further described hereinbelow with reference to Table 1.

[38833] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2778 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38834] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2779 (VGAM2779) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38835] VGAM2779 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2779 was detected is described hereinabove with reference to Figs. 2-8.

[38836] VGAM2779 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2779 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38837] VGAM2779 gene, herein designated VGAM GENE, encodes a VGAM2779 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2779 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2779 precursor RNA is designated SEQ ID:2476, and is provided hereinbelow with reference to the sequence listing part.

[38838] VGAM2779 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38839] An enzyme complex designated DICER COMPLEX, dices the VGAM2779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2779 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2779 RNA is designated SEQ ID:5546, and is provided hereinbelow with reference to the sequence listing part.

[38840] VGAM2779 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38841] VGAM2779 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2779 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2779 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38842] The complementary binding of VGAM2779 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2779 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2779 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38843] It is appreciated that VGAM2779 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2779 host target genes. The mRNA of each one of this plurality of VGAM2779 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2779 RNA, herein designated VGAM RNA, and which when bound by VGAM2779 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2779 host target proteins.

[38844] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2779 gene, herein designated VGAM GENE, on one or more VGAM2779 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38845] It is yet further appreciated that a function of VGAM2779 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2779 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2779 correlate with, and may be deduced from, the identity of the host target genes which VGAM2779 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38846] Nucleotide sequences of the VGAM2779 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2779 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2779 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2779 are further described hereinbelow with reference to Table 1.

[38847] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2779 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38848] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2780 (VGAM2780) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38849] VGAM2780 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2780 was detected is described hereinabove with reference to Figs. 2-8.

[38850] VGAM2780 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2780 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38851] VGAM2780 gene, herein designated VGAM GENE, encodes a VGAM2780 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2780 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2780 precursor RNA is designated SEQ ID:2477, and is provided hereinbelow with reference to the sequence listing part.

[38852] VGAM2780 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38853] An enzyme complex designated DICER COMPLEX, dices the VGAM2780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2780 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2780 RNA is designated SEQ ID:5547, and is provided hereinbelow with reference to the sequence listing part.

[38854] VGAM2780 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38855] VGAM2780 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2780 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2780 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38856] The complementary binding of VGAM2780 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2780 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2780 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38857] It is appreciated that VGAM2780 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2780 host target genes. The mRNA of each one of this plurality of VGAM2780 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2780 RNA, herein designated VGAM RNA, and which when bound by VGAM2780 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2780 host target proteins.

[38858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2780 gene, herein designated VGAM GENE, on one or more VGAM2780 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38859] It is yet further appreciated that a function of VGAM2780 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2780 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2780 correlate with, and may be deduced from, the identity of the host target genes which VGAM2780 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38860] Nucleotide sequences of the VGAM2780 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2780 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2780 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2780 are further described hereinbelow with reference to Table 1.

[38861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2780 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38862] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2781 (VGAM2781) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38863] VGAM2781 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2781 was detected is described hereinabove with reference to Figs. 2-8.

[38864] VGAM2781 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM2781 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38865] VGAM2781 gene, herein designated VGAM GENE, encodes a VGAM2781 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2781 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2781 precursor RNA is designated SEQ ID:2466, and is provided hereinbelow with reference to the sequence listing part.

[38866] VGAM2781 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38867] An enzyme complex designated DICER COMPLEX, dices the VGAM2781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2781 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2781 RNA is designated SEQ ID:5536, and is provided hereinbelow with reference to the sequence listing part.

[38868] VGAM2781 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38869] VGAM2781 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2781 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2781 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38870] The complementary binding of VGAM2781 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2781 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2781 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38871] It is appreciated that VGAM2781 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2781 host target genes. The mRNA of

each one of this plurality of VGAM2781 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2781 RNA, herein designated VGAM RNA, and which when bound by VGAM2781 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2781 host target proteins.

[38872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2781 gene, herein designated VGAM GENE, on one or more VGAM2781 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[38873] It is yet further appreciated that a function of VGAM2781 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2781 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2781 correlate with, and may be deduced from, the identity of the host target genes which VGAM2781 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38874] Nucleotide sequences of the VGAM2781 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2781 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2781 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2781 are further described hereinbelow with reference to Table 1.

[38875] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2781 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[38876] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2782 (VGAM2782) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38877] VGAM2782 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2782 was detected is described hereinabove with reference to Figs. 2-8.

[38878] VGAM2782 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2782 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38879] VGAM2782 gene, herein designated VGAM GENE, encodes a VGAM2782 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2782 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2782 precursor RNA is designated SEQ ID:2467, and is provided hereinbelow with reference to the sequence listing part.

[38880] VGAM2782 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38881] An enzyme complex designated DICER COMPLEX, dices the VGAM2782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2782 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2782 RNA is designated SEQ ID:5537, and

is provided hereinbelow with reference to the sequence listing part.

[38882] VGAM2782 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38883] VGAM2782 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2782 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2782 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38884] The complementary binding of VGAM2782 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2782 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2782 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38885] It is appreciated that VGAM2782 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2782 host target genes. The mRNA of each one of this plurality of VGAM2782 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2782 RNA, herein designated VGAM RNA, and which when bound by VGAM2782 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2782 host target proteins.

[38886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2782 gene, herein designated VGAM GENE, on one or more VGAM2782 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38887] It is yet further appreciated that a function of VGAM2782 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2782 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2782 correlate with, and may be deduced from, the identity of the host target genes which VGAM2782 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38888] Nucleotide sequences of the VGAM2782 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2782 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2782 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2782 are further described hereinbelow with reference to Table 1.

[38889] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2782 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38890] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2783 (VGAM2783) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38891] VGAM2783 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2783 was detected is described hereinabove with reference to Figs. 2-8.

[38892] VGAM2783 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2783 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38893] VGAM2783 gene, herein designated VGAM GENE, encodes a VGAM2783 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2783 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2783 precur-

sor RNA is designated SEQ ID:2468, and is provided hereinbelow with reference to the sequence listing part.

[38894] VGAM2783 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38895] An enzyme complex designated DICER COMPLEX, dices the VGAM2783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2783 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2783 RNA is designated SEQ ID:5538, and is provided hereinbelow with reference to the sequence

listing part.

[38896] VGAM2783 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38897] VGAM2783 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2783 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2783 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38898] The complementary binding of VGAM2783 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2783 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2783 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38899] It is appreciated that VGAM2783 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2783 host target genes. The mRNA of each one of this plurality of VGAM2783 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2783 RNA, herein designated VGAM RNA, and which when bound by VGAM2783 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2783 host target proteins.

[38900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2783 gene, herein designated VGAM GENE, on one or more VGAM2783 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38901] It is yet further appreciated that a function of VGAM2783

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2783 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2783 correlate with, and may be deduced from, the identity of the host target genes which VGAM2783 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38902] Nucleotide sequences of the VGAM2783 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2783 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2783 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2783 are further described hereinbelow with reference to Table 1.

[38903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2783 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38904] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2784 (VGAM2784) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38905] VGAM2784 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2784 was detected is described hereinabove with reference to Figs. 2-8.

[38906] VGAM2784 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2784 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38907] VGAM2784 gene, herein designated VGAM GENE, encodes a VGAM2784 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2784 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2784 precursor RNA is designated SEQ ID:2470, and is provided here-

inbelow with reference to the sequence listing part.

[38908] VGAM2784 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38909] An enzyme complex designated DICER COMPLEX, dices the VGAM2784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2784 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2784 RNA is designated SEQ ID:5540, and is provided hereinbelow with reference to the sequence listing part.

[38910] VGAM2784 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38911] VGAM2784 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2784 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2784 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38912] The complementary binding of VGAM2784 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2784 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2784 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38913] It is appreciated that VGAM2784 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2784 host target genes. The mRNA of each one of this plurality of VGAM2784 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2784 RNA, herein designated VGAM RNA, and which when bound by VGAM2784 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2784 host target proteins.

[38914] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2784 gene, herein designated VGAM GENE, on one or more VGAM2784 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38915] It is yet further appreciated that a function of VGAM2784 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2784 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2784 correlate with, and may be deduced from, the identity of the host target genes which VGAM2784 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38916] Nucleotide sequences of the VGAM2784 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2784 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2784 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2784 are further described hereinbelow with reference to Table 1.

[38917] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2784 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38918] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2785 (VGAM2785) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38919] VGAM2785 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2785 was detected is described hereinabove with reference to Figs. 2-8.

[38920] VGAM2785 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM2785 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38921] VGAM2785 gene, herein designated VGAM GENE, encodes a VGAM2785 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2785 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2785 precursor RNA is designated SEQ ID:2471, and is provided hereinbelow with reference to the sequence listing part.

[38922] VGAM2785 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38923] An enzyme complex designated DICER COMPLEX, dices the VGAM2785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2785 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2785 RNA is designated SEQ ID:5541, and is provided hereinbelow with reference to the sequence listing part.

[38924] VGAM2785 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38925] VGAM2785 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2785 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2785 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38926] The complementary binding of VGAM2785 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2785 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2785 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38927] It is appreciated that VGAM2785 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2785 host target genes. The mRNA of each one of this plurality of VGAM2785 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2785 RNA, herein designated VGAM

RNA, and which when bound by VGAM2785 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2785 host target proteins.

[38928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2785 gene, herein designated VGAM GENE, on one or more VGAM2785 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38929] It is yet further appreciated that a function of VGAM2785 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2785 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2785 correlate with, and may be deduced from, the identity of the host target genes which VGAM2785 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38930] Nucleotide sequences of the VGAM2785 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2785 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2785 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2785 are further described hereinbelow with reference to Table 1.

[38931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2785 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38932] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2786 (VGAM2786) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38933] VGAM2786 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2786 was detected is described hereinabove with reference to Figs. 2-8.

[38934] VGAM2786 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM2786 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38935] VGAM2786 gene, herein designated VGAM GENE, encodes a VGAM2786 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2786 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2786 precursor RNA is designated SEQ ID:2478, and is provided hereinbelow with reference to the sequence listing part.

[38936] VGAM2786 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38937] An enzyme complex designated DICER COMPLEX, dices the VGAM2786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2786 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2786 RNA is designated SEQ ID:5548, and is provided hereinbelow with reference to the sequence listing part.

[38938] VGAM2786 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2786 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2786 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38939] VGAM2786 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2786 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2786 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2786 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2786 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38940] The complementary binding of VGAM2786 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2786 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2786 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2786 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38941] It is appreciated that VGAM2786 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2786 host target genes. The mRNA of each one of this plurality of VGAM2786 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2786 RNA, herein designated VGAM RNA, and which when bound by VGAM2786 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2786 host target proteins.

[38942] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2786 gene, herein designated VGAM GENE, on one or more VGAM2786 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38943] It is yet further appreciated that a function of VGAM2786 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2786 include diagnosis, prevention and

treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2786 correlate with, and may be deduced from, the identity of the host target genes which VGAM2786 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38944] Nucleotide sequences of the VGAM2786 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2786 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2786 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2786 are further described hereinbelow with reference to Table 1.

[38945] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2786 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38946] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2787 (VGAM2787) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38947] VGAM2787 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2787 was detected is described hereinabove with reference to Figs. 2-8.

[38948] VGAM2787 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barley yellow mosaic virus. VGAM2787 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38949] VGAM2787 gene, herein designated VGAM GENE, encodes a VGAM2787 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2787 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2787 precursor RNA is designated SEQ ID:2472, and is provided hereinbelow with reference to the sequence listing part.

[38950] VGAM2787 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2787 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38951] An enzyme complex designated DICER COMPLEX, dices the VGAM2787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2787 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2787 RNA is designated SEQ ID:5542, and is provided hereinbelow with reference to the sequence listing part.

[38952] VGAM2787 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2787 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2787 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38953] VGAM2787 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2787 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2787 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2787 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2787 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38954] The complementary binding of VGAM2787 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2787 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2787 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2787 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38955] It is appreciated that VGAM2787 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2787 host target genes. The mRNA of each one of this plurality of VGAM2787 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2787 RNA, herein designated VGAM RNA, and which when bound by VGAM2787 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2787 host target proteins.

[38956] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2787 gene, herein designated VGAM GENE, on one or more VGAM2787 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38957] It is yet further appreciated that a function of VGAM2787 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2787 include diagnosis, prevention and treatment of viral infection by Barley yellow mosaic virus.

Specific functions, and accordingly utilities, of VGAM2787 correlate with, and may be deduced from, the identity of the host target genes which VGAM2787 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38958] Nucleotide sequences of the VGAM2787 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2787 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2787 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2787 are further described hereinbelow with reference to Table 1.

[38959] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2787 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38960] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2788 (VGAM2788) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[38961] VGAM2788 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2788 was detected is described hereinabove with reference to Figs. 2-8.

[38962] VGAM2788 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Indian citrus ringspot virus. VGAM2788 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38963] VGAM2788 gene, herein designated VGAM GENE, encodes a VGAM2788 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2788 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2788 precursor RNA is designated SEQ ID:2479, and is provided hereinbelow with reference to the sequence listing part.

[38964] VGAM2788 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2788 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38965] An enzyme complex designated DICER COMPLEX, dices the VGAM2788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2788 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2788 RNA is designated SEQ ID:5549, and is provided hereinbelow with reference to the sequence listing part.

[38966] VGAM2788 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2788 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2788 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38967] VGAM2788 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2788 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2788 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2788 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2788 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38968] The complementary binding of VGAM2788 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2788 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2788 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2788 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38969] It is appreciated that VGAM2788 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2788 host target genes. The mRNA of each one of this plurality of VGAM2788 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2788 RNA, herein designated VGAM RNA, and which when bound by VGAM2788 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2788 host target proteins.

[38970] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2788 gene, herein designated VGAM GENE, on one or more VGAM2788 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38971] It is yet further appreciated that a function of VGAM2788 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2788 include diagnosis, prevention and treatment of viral infection by Indian citrus ringspot virus. Specific functions, and accordingly utilities, of VGAM2788

correlate with, and may be deduced from, the identity of the host target genes which VGAM2788 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38972] Nucleotide sequences of the VGAM2788 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2788 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2788 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2788 are further described hereinbelow with reference to Table 1.

[38973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2788 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38974] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2789 (VGAM2789) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[38975] VGAM2789 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2789 was detected is described hereinabove with reference to Figs. 2-8.

[38976] VGAM2789 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM2789 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38977] VGAM2789 gene, herein designated VGAM GENE, encodes a VGAM2789 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2789 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2789 precursor RNA is designated SEQ ID:2480, and is provided hereinbelow with reference to the sequence listing part.

[38978] VGAM2789 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38979] An enzyme complex designated DICER COMPLEX, dices the VGAM2789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2789 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2789 RNA is designated SEQ ID:5550, and is provided hereinbelow with reference to the sequence listing part.

[38980] VGAM2789 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38981] VGAM2789 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2789 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2789 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38982] The complementary binding of VGAM2789 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2789 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2789 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38983] It is appreciated that VGAM2789 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2789 host target genes. The mRNA of each one of this plurality of VGAM2789 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2789 RNA, herein designated VGAM RNA, and which when bound by VGAM2789 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2789 host target proteins.

[38984] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2789 gene, herein designated VGAM GENE, on one or more VGAM2789 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38985] It is yet further appreciated that a function of VGAM2789 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2789 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2789 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2789 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[38986] Nucleotide sequences of the VGAM2789 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2789 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2789 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2789 are further described hereinbelow with reference to Table 1.

[38987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2789 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[38988] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2790 (VGAM2790) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[38989] VGAM2790 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2790 was detected is described hereinabove with reference to Figs. 2-8.

[38990] VGAM2790 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM2790 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[38991] VGAM2790 gene, herein designated VGAM GENE, encodes a VGAM2790 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2790 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2790 precursor RNA is designated SEQ ID:2481, and is provided hereinbelow with reference to the sequence listing part.

[38992] VGAM2790 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[38993] An enzyme complex designated DICER COMPLEX, dices the VGAM2790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2790 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2790 RNA is designated SEQ ID:5551, and is provided hereinbelow with reference to the sequence listing part.

[38994] VGAM2790 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[38995] VGAM2790 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2790 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2790 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[38996] The complementary binding of VGAM2790 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2790 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2790 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[38997] It is appreciated that VGAM2790 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2790 host target genes. The mRNA of each one of this plurality of VGAM2790 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2790 RNA, herein designated VGAM RNA, and which when bound by VGAM2790 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2790 host target proteins.

[38998] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2790 gene, herein designated VGAM GENE, on one or more VGAM2790 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[38999] It is yet further appreciated that a function of VGAM2790 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2790 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2790 correlate with, and may be deduced from, the identity of the host target genes which VGAM2790 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[39000] Nucleotide sequences of the VGAM2790 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2790 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2790 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2790 are further described hereinbelow with reference to Table 1.

[39001] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2790 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39002] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2791 (VGAM2791) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39003] VGAM2791 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2791 was detected is described hereinabove with reference to Figs. 2-8.

[39004] VGAM2791 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2791 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39005] VGAM2791 gene, herein designated VGAM GENE, encodes a VGAM2791 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2791 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2791 precursor RNA is designated SEQ ID:2473, and is provided hereinbelow with reference to the sequence listing part.

[39006] VGAM2791 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39007] An enzyme complex designated DICER COMPLEX, dices the VGAM2791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2791 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2791 RNA is designated SEQ ID:5543, and is provided hereinbelow with reference to the sequence listing part.

[39008] VGAM2791 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39009] VGAM2791 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2791 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2791 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[39010] The complementary binding of VGAM2791 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2791 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2791 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39011] It is appreciated that VGAM2791 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2791 host target genes. The mRNA of each one of this plurality of VGAM2791 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2791 RNA, herein designated VGAM RNA, and which when bound by VGAM2791 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2791 host target proteins.

[39012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2791 gene, herein designated VGAM GENE, on one or more VGAM2791 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39013] It is yet further appreciated that a function of VGAM2791 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2791 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2791 correlate with, and may be deduced from, the identity of the host target genes which VGAM2791 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[39014] Nucleotide sequences of the VGAM2791 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2791 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2791 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2791 are further described hereinbelow with reference to Table 1.

[39015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2791 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39016] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2792 (VGAM2792) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39017] VGAM2792 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2792 was detected is described hereinabove with reference to Figs. 2-8.

[39018] VGAM2792 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Barmah Forest virus. VGAM2792 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39019] VGAM2792 gene, herein designated VGAM GENE, encodes a VGAM2792 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2792 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2792 precursor RNA is designated SEQ ID:2474, and is provided hereinbelow with reference to the sequence listing part.

[39020] VGAM2792 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39021] An enzyme complex designated DICER COMPLEX, dices the VGAM2792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2792 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2792 RNA is designated SEQ ID:5544, and is provided hereinbelow with reference to the sequence listing part.

[39022] VGAM2792 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[39023] VGAM2792 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2792 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2792 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39024] The complementary binding of VGAM2792 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2792 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2792 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39025] It is appreciated that VGAM2792 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2792 host target genes. The mRNA of each one of this plurality of VGAM2792 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2792 RNA, herein designated VGAM RNA, and which when bound by VGAM2792 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2792 host target proteins.

[39026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2792 gene, herein designated VGAM GENE, on one

or more VGAM2792 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39027] It is yet further appreciated that a function of VGAM2792 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2792 include diagnosis, prevention and treatment of viral infection by Barmah Forest virus. Specific functions, and accordingly utilities, of VGAM2792 correlate with, and may be deduced from, the identity of the host target genes which VGAM2792 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39028] Nucleotide sequences of the VGAM2792 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2792 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2792 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2792 are further described hereinbelow with reference to Table 1.

[39029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2792 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39030] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2793 (VGAM2793) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39031] VGAM2793 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2793 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[39032] VGAM2793 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2793 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39033] VGAM2793 gene, herein designated VGAM GENE, encodes a VGAM2793 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2793 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2793 precursor RNA is designated SEQ ID:2475, and is provided hereinbelow with reference to the sequence listing part.

[39034] VGAM2793 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39035] An enzyme complex designated DICER COMPLEX, dices the VGAM2793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2793 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2793 RNA is designated SEQ ID:5545, and is provided hereinbelow with reference to the sequence listing part.

[39036] VGAM2793 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39037] VGAM2793 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2793 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2793 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39038] The complementary binding of VGAM2793 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2793 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2793 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39039] It is appreciated that VGAM2793 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2793 host target genes. The mRNA of each one of this plurality of VGAM2793 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2793 RNA, herein designated VGAM RNA, and which when bound by VGAM2793 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2793 host target proteins.

[39040] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2793 gene, herein designated VGAM GENE, on one or more VGAM2793 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39041] It is yet further appreciated that a function of VGAM2793 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2793 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2793 correlate with, and may be deduced from, the identity of the host target genes which VGAM2793 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39042] Nucleotide sequences of the VGAM2793 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2793 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2793 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2793 are further described hereinbelow with reference to Table 1.

[39043] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2793 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39044] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2794 (VGAM2794) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39045] VGAM2794 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2794 was detected is described hereinabove with reference to Figs. 2-8.

[39046] VGAM2794 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2794 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39047] VGAM2794 gene, herein designated VGAM GENE, encodes a VGAM2794 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2794 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2794 precursor RNA is designated SEQ ID:2482, and is provided hereinbelow with reference to the sequence listing part.

[39048] VGAM2794 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[39049] An enzyme complex designated DICER COMPLEX, dices the VGAM2794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2794 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2794 RNA is designated SEQ ID:5552, and is provided hereinbelow with reference to the sequence listing part.

[39050] VGAM2794 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39051] VGAM2794 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2794 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2794 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39052] The complementary binding of VGAM2794 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2794 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2794 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39053] It is appreciated that VGAM2794 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2794 host target genes. The mRNA of each one of this plurality of VGAM2794 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2794 RNA, herein designated VGAM RNA, and which when bound by VGAM2794 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2794 host target proteins.

[39054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2794 gene, herein designated VGAM GENE, on one or more VGAM2794 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39055] It is yet further appreciated that a function of VGAM2794 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2794 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2794 correlate with, and may be deduced from, the identity of the host target genes which VGAM2794 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39056] Nucleotide sequences of the VGAM2794 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2794 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2794 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2794 are further described hereinbelow with reference to Table 1.

[39057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2794 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39058] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2795 (VGAM2795) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39059] VGAM2795 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2795 was detected is described hereinabove with reference to Figs. 2-8.

[39060] VGAM2795 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Strawberry mild yellow edge virus. VGAM2795 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39061] VGAM2795 gene, herein designated VGAM GENE, encodes a VGAM2795 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2795 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2795 precursor RNA is designated SEQ ID:2483, and is provided hereinbelow with reference to the sequence listing part.

[39062] VGAM2795 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39063] An enzyme complex designated DICER COMPLEX, dices the VGAM2795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2795 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2795 RNA is designated SEQ ID:5553, and is provided hereinbelow with reference to the sequence listing part.

[39064] VGAM2795 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2795 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2795 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39065] VGAM2795 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2795 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2795 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2795 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2795 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39066] The complementary binding of VGAM2795 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2795 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2795 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2795 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39067] It is appreciated that VGAM2795 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2795 host target genes. The mRNA of each one of this plurality of VGAM2795 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2795 RNA, herein designated VGAM RNA, and which when bound by VGAM2795 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2795 host target proteins.

[39068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2795 gene, herein designated VGAM GENE, on one or more VGAM2795 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39069] It is yet further appreciated that a function of VGAM2795 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2795 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM2795 correlate with, and may be deduced from, the identity of the host target genes which VGAM2795 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39070] Nucleotide sequences of the VGAM2795 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2795 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2795 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2795 are further described hereinbelow with reference to Table 1.

[39071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2795 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39072] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2796 (VGAM2796) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39073] VGAM2796 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2796 was detected is described hereinabove with reference to Figs. 2-8.

[39074] VGAM2796 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4.

VGAM2796 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39075] VGAM2796 gene, herein designated VGAM GENE, encodes a VGAM2796 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2796 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2796 precursor RNA is designated SEQ ID:2484, and is provided hereinbelow with reference to the sequence listing part.

[39076] VGAM2796 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39077] An enzyme complex designated DICER COMPLEX, dices

the VGAM2796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2796 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2796 RNA is designated SEQ ID:5554, and is provided hereinbelow with reference to the sequence listing part.

[39078] VGAM2796 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2796 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2796 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39079] VGAM2796 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2796 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2796 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2796 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2796 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39080] The complementary binding of VGAM2796 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2796 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2796 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2796 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39081] It is appreciated that VGAM2796 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2796 host target genes. The mRNA of each one of this plurality of VGAM2796 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2796 RNA, herein designated VGAM RNA, and which when bound by VGAM2796 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2796 host target proteins.

[39082] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2796 gene, herein designated VGAM GENE, on one or more VGAM2796 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39083] It is yet further appreciated that a function of VGAM2796 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2796 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2796 correlate with, and may be deduced from, the identity of the host target genes which VGAM2796 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39084] Nucleotide sequences of the VGAM2796 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2796 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2796 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2796 are further described hereinbelow with reference to Table 1.

[39085] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2796 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39086] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2797 (VGAM2797) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39087] VGAM2797 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2797 was detected is described hereinabove with reference to Figs. 2-8.

[39088] VGAM2797 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine respiratory syncytial virus. VGAM2797 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39089] VGAM2797 gene, herein designated VGAM GENE, encodes a VGAM2797 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2797 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2797 precursor RNA is designated SEQ ID:2486, and is provided hereinbelow with reference to the sequence listing part.

[39090] VGAM2797 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2797 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39091] An enzyme complex designated DICER COMPLEX, dices the VGAM2797 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2797 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2797 RNA is designated SEQ ID:5556, and is provided hereinbelow with reference to the sequence listing part.

[39092] VGAM2797 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2797 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2797 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39093] VGAM2797 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2797 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2797 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2797 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2797 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39094] The complementary binding of VGAM2797 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2797 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2797

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2797 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39095] It is appreciated that VGAM2797 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2797 host target genes. The mRNA of each one of this plurality of VGAM2797 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2797 RNA, herein designated VGAM RNA, and which when bound by VGAM2797 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2797 host target proteins.

[39096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2797 gene, herein designated VGAM GENE, on one or more VGAM2797 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39097] It is yet further appreciated that a function of VGAM2797 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2797 include diagnosis, prevention and treatment of viral infection by Bovine respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM2797 correlate with, and may be deduced from, the identity of the host target genes which VGAM2797 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39098] Nucleotide sequences of the VGAM2797 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2797 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2797 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2797 are further described hereinbelow with reference to Table 1.

[39099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2797 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39100] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2798 (VGAM2798) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39101] VGAM2798 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2798 was detected is described hereinabove with reference to Figs. 2-8.

[39102] VGAM2798 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM2798 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[39103] VGAM2798 gene, herein designated VGAM GENE, encodes a VGAM2798 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2798 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2798 precursor RNA is designated SEQ ID:2485, and is provided hereinbelow with reference to the sequence listing part.

[39104] VGAM2798 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39105] An enzyme complex designated DICER COMPLEX, dices the VGAM2798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2798 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2798 RNA is designated SEQ ID:5555, and is provided hereinbelow with reference to the sequence listing part.

[39106] VGAM2798 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2798 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2798 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39107] VGAM2798 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2798 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2798 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2798 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2798 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39108] The complementary binding of VGAM2798 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2798 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2798 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2798 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39109] It is appreciated that VGAM2798 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2798 host target genes. The mRNA of each one of this plurality of VGAM2798 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2798 RNA, herein designated VGAM RNA, and which when bound by VGAM2798 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2798 host target proteins.

[39110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2798 gene, herein designated VGAM GENE, on one or more VGAM2798 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39111] It is yet further appreciated that a function of VGAM2798 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2798 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM2798 correlate with, and may be deduced from, the identity of the host target genes which VGAM2798 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39112] Nucleotide sequences of the VGAM2798 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2798 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2798 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2798 are further

described hereinbelow with reference to Table 1.

[39113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2798 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39114] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2799 (VGAM2799) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39115] VGAM2799 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2799 was detected is described hereinabove with reference to Figs. 2-8.

[39116] VGAM2799 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM2799 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39117] VGAM2799 gene, herein designated VGAM GENE, encodes a VGAM2799 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2799 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2799 precursor RNA is designated SEQ ID:2490, and is provided hereinbelow with reference to the sequence listing part.

[39118] VGAM2799 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39119] An enzyme complex designated DICER COMPLEX, dices the VGAM2799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2799 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2799 RNA is designated SEQ ID:5560, and is provided hereinbelow with reference to the sequence listing part.

[39120] VGAM2799 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39121] VGAM2799 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2799 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2799 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39122] The complementary binding of VGAM2799 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2799 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2799 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39123] It is appreciated that VGAM2799 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2799 host target genes. The mRNA of each one of this plurality of VGAM2799 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2799 RNA, herein designated VGAM RNA, and which when bound by VGAM2799 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2799 host target proteins.

[39124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2799 gene, herein designated VGAM GENE, on one or more VGAM2799 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39125] It is yet further appreciated that a function of VGAM2799 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2799 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2799 correlate with, and may be deduced from, the identity of the host target genes which VGAM2799 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39126] Nucleotide sequences of the VGAM2799 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2799 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2799 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2799 are further described hereinbelow with reference to Table 1.

[39127] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2799 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39128] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2800 (VGAM2800) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39129] VGAM2800 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2800 was detected is described hereinabove with reference to Figs. 2-8.

[39130] VGAM2800 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2800 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39131] VGAM2800 gene, herein designated VGAM GENE, encodes

a VGAM2800 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2800 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2800 precursor RNA is designated SEQ ID:2491, and is provided hereinbelow with reference to the sequence listing part.

[39132] VGAM2800 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39133] An enzyme complex designated DICER COMPLEX, dices the VGAM2800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2800 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2800 RNA is designated SEQ ID:5561, and is provided hereinbelow with reference to the sequence listing part.

[39134] VGAM2800 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39135] VGAM2800 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2800 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2800 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39136] The complementary binding of VGAM2800 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2800 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2800 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[39137] It is appreciated that VGAM2800 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2800 host target genes. The mRNA of each one of this plurality of VGAM2800 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2800 RNA, herein designated VGAM RNA, and which when bound by VGAM2800 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2800 host target proteins.

[39138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2800 gene, herein designated VGAM GENE, on one or more VGAM2800 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39139] It is yet further appreciated that a function of VGAM2800 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2800 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2800 correlate with, and may be deduced from, the identity of the host target genes which VGAM2800 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39140] Nucleotide sequences of the VGAM2800 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2800 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2800 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2800 are further described hereinbelow with reference to Table 1.

[39141] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2800 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39142] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2801 (VGAM2801) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39143] VGAM2801 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2801 was detected is described hereinabove with reference to Figs. 2-8.

[39144] VGAM2801 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6B. VGAM2801 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39145] VGAM2801 gene, herein designated VGAM GENE, encodes a VGAM2801 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2801 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2801 precursor RNA is designated SEQ ID:2487, and is provided hereinbelow with reference to the sequence listing part.

[39146] VGAM2801 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39147] An enzyme complex designated DICER COMPLEX, dices the VGAM2801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2801 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2801 RNA is designated SEQ ID:5557, and is provided hereinbelow with reference to the sequence listing part.

[39148] VGAM2801 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39149] VGAM2801 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2801 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2801 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39150] The complementary binding of VGAM2801 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2801 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2801 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39151] It is appreciated that VGAM2801 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2801 host target genes. The mRNA of each one of this plurality of VGAM2801 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2801 RNA, herein designated VGAM RNA, and which when bound by VGAM2801 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2801 host target proteins.

[39152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2801 gene, herein designated VGAM GENE, on one or more VGAM2801 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39153] It is yet further appreciated that a function of VGAM2801 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2801 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6B. Specific functions, and accordingly utilities, of VGAM2801 correlate with, and may be deduced from, the identity of the host target genes which VGAM2801 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39154] Nucleotide sequences of the VGAM2801 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2801 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2801 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2801 are further described hereinbelow with reference to Table 1.

[39155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2801 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39156] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2802 (VGAM2802) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39157] VGAM2802 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2802 was detected is described hereinabove with reference to Figs. 2-8.

[39158] VGAM2802 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2802 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39159] VGAM2802 gene, herein designated VGAM GENE, encodes a VGAM2802 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2802 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2802 precursor RNA is designated SEQ ID:2498, and is provided hereinbelow with reference to the sequence listing part.

[39160] VGAM2802 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39161] An enzyme complex designated DICER COMPLEX, dices the VGAM2802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2802 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2802 RNA is designated SEQ ID:5568, and is provided hereinbelow with reference to the sequence listing part.

[39162] VGAM2802 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39163] VGAM2802 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2802 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2802 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39164] The complementary binding of VGAM2802 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2802 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2802 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39165] It is appreciated that VGAM2802 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2802 host target genes. The mRNA of each one of this plurality of VGAM2802 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2802 RNA, herein designated VGAM RNA, and which when bound by VGAM2802 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2802 host target proteins.

[39166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2802 gene, herein designated VGAM GENE, on one or more VGAM2802 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39167] It is yet further appreciated that a function of VGAM2802 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2802 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2802 correlate with, and may be deduced from, the identity of the host target genes which VGAM2802 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39168] Nucleotide sequences of the VGAM2802 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2802 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2802 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2802 are further described hereinbelow with reference to Table 1.

[39169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2802 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39170] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2803 (VGAM2803) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39171] VGAM2803 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2803 was detected is described hereinabove with reference to Figs. 2-8.

[39172] VGAM2803 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2803 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39173] VGAM2803 gene, herein designated VGAM GENE, encodes a VGAM2803 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2803 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2803 precursor RNA is designated SEQ ID:2492, and is provided hereinbelow with reference to the sequence listing part.

[39174] VGAM2803 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39175] An enzyme complex designated DICER COMPLEX, dices the VGAM2803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2803 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2803 RNA is designated SEQ ID:5562, and is provided hereinbelow with reference to the sequence listing part.

[39176] VGAM2803 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39177] VGAM2803 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2803 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2803 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39178] The complementary binding of VGAM2803 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2803 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2803 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39179] It is appreciated that VGAM2803 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2803 host target genes. The mRNA of each one of this plurality of VGAM2803 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2803 RNA, herein designated VGAM RNA, and which when bound by VGAM2803 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2803 host target proteins.

[39180] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2803 gene, herein designated VGAM GENE, on one or more VGAM2803 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39181] It is yet further appreciated that a function of VGAM2803 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2803 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2803 correlate with, and may be deduced from, the identity of the host target genes which VGAM2803 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39182] Nucleotide sequences of the VGAM2803 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2803 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2803 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2803 are further described hereinbelow with reference to Table 1.

[39183] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2803 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39184] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2804 (VGAM2804) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39185] VGAM2804 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2804 was detected is described hereinabove with reference to Figs. 2-8.

[39186] VGAM2804 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2804 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39187] VGAM2804 gene, herein designated VGAM GENE, encodes a VGAM2804 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2804 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2804 precursor RNA is designated SEQ ID:2488, and is provided hereinbelow with reference to the sequence listing part.

[39188] VGAM2804 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39189] An enzyme complex designated DICER COMPLEX, dices the VGAM2804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2804 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2804 RNA is designated SEQ ID:5558, and is provided hereinbelow with reference to the sequence listing part.

[39190] VGAM2804 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39191] VGAM2804 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2804 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2804 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39192] The complementary binding of VGAM2804 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2804 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2804 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39193] It is appreciated that VGAM2804 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2804 host target genes. The mRNA of

each one of this plurality of VGAM2804 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2804 RNA, herein designated VGAM RNA, and which when bound by VGAM2804 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2804 host target proteins.

[39194] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2804 gene, herein designated VGAM GENE, on one or more VGAM2804 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[39195] It is yet further appreciated that a function of VGAM2804 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2804 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2804 correlate with, and may be deduced from, the identity of the host target genes which VGAM2804 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39196] Nucleotide sequences of the VGAM2804 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2804 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2804 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2804 are further described hereinbelow with reference to Table 1.

[39197] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2804 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[39198] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2805 (VGAM2805) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39199] VGAM2805 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2805 was detected is described hereinabove with reference to Figs. 2-8.

[39200] VGAM2805 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM2805 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39201] VGAM2805 gene, herein designated VGAM GENE, encodes a VGAM2805 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2805 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2805 precursor RNA is designated SEQ ID:2502, and is provided hereinbelow with reference to the sequence listing part.

[39202] VGAM2805 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39203] An enzyme complex designated DICER COMPLEX, dices the VGAM2805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2805 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2805 RNA is designated SEQ ID:5572, and

is provided hereinbelow with reference to the sequence listing part.

[39204] VGAM2805 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39205] VGAM2805 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2805 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2805 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39206] The complementary binding of VGAM2805 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2805 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2805 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39207] It is appreciated that VGAM2805 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2805 host target genes. The mRNA of each one of this plurality of VGAM2805 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2805 RNA, herein designated VGAM RNA, and which when bound by VGAM2805 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2805 host target proteins.

[39208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2805 gene, herein designated VGAM GENE, on one or more VGAM2805 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39209] It is yet further appreciated that a function of VGAM2805 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2805 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM2805 correlate with, and may be deduced from, the identity of the host target genes which VGAM2805 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39210] Nucleotide sequences of the VGAM2805 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2805 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2805 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2805 are further described hereinbelow with reference to Table 1.

[39211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2805 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39212] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2806 (VGAM2806) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39213] VGAM2806 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2806 was detected is described hereinabove with reference to Figs. 2-8.

[39214] VGAM2806 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2806 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39215] VGAM2806 gene, herein designated VGAM GENE, encodes a VGAM2806 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2806 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2806 precur-

sor RNA is designated SEQ ID:2489, and is provided hereinbelow with reference to the sequence listing part.

[39216] VGAM2806 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39217] An enzyme complex designated DICER COMPLEX, dices the VGAM2806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2806 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2806 RNA is designated SEQ ID:5559, and is provided hereinbelow with reference to the sequence

listing part.

[39218] VGAM2806 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39219] VGAM2806 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2806 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2806 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39220] The complementary binding of VGAM2806 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2806 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2806 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39221] It is appreciated that VGAM2806 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2806 host target genes. The mRNA of each one of this plurality of VGAM2806 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2806 RNA, herein designated VGAM RNA, and which when bound by VGAM2806 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2806 host target proteins.

[39222] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2806 gene, herein designated VGAM GENE, on one or more VGAM2806 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39223] It is yet further appreciated that a function of VGAM2806

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2806 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2806 correlate with, and may be deduced from, the identity of the host target genes which VGAM2806 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39224] Nucleotide sequences of the VGAM2806 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2806 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2806 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2806 are further described hereinbelow with reference to Table 1.

[39225] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2806 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39226] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2807 (VGAM2807) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39227] VGAM2807 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2807 was detected is described hereinabove with reference to Figs. 2-8.

[39228] VGAM2807 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2807 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39229] VGAM2807 gene, herein designated VGAM GENE, encodes a VGAM2807 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2807 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2807 precursor RNA is designated SEQ ID:2493, and is provided here-

inbelow with reference to the sequence listing part.

[39230] VGAM2807 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39231] An enzyme complex designated DICER COMPLEX, dices the VGAM2807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2807 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2807 RNA is designated SEQ ID:5563, and is provided hereinbelow with reference to the sequence listing part.

[39232] VGAM2807 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39233] VGAM2807 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2807 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2807 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39234] The complementary binding of VGAM2807 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2807 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2807 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39235] It is appreciated that VGAM2807 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2807 host target genes. The mRNA of each one of this plurality of VGAM2807 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2807 RNA, herein designated VGAM RNA, and which when bound by VGAM2807 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2807 host target proteins.

[39236] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2807 gene, herein designated VGAM GENE, on one or more VGAM2807 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39237] It is yet further appreciated that a function of VGAM2807 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2807 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2807 correlate with, and may be deduced from, the identity of the host target genes which VGAM2807 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39238] Nucleotide sequences of the VGAM2807 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2807 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2807 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2807 are further described hereinbelow with reference to Table 1.

[39239] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2807 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39240] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2808 (VGAM2808) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39241] VGAM2808 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2808 was detected is described hereinabove with reference to Figs. 2-8.

[39242] VGAM2808 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM2808 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39243] VGAM2808 gene, herein designated VGAM GENE, encodes a VGAM2808 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2808 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2808 precursor RNA is designated SEQ ID:2503, and is provided hereinbelow with reference to the sequence listing part.

[39244] VGAM2808 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39245] An enzyme complex designated DICER COMPLEX, dices the VGAM2808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2808 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2808 RNA is designated SEQ ID:5573, and is provided hereinbelow with reference to the sequence listing part.

[39246] VGAM2808 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39247] VGAM2808 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2808 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2808 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39248] The complementary binding of VGAM2808 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2808 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2808 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39249] It is appreciated that VGAM2808 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2808 host target genes. The mRNA of each one of this plurality of VGAM2808 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2808 RNA, herein designated VGAM

RNA, and which when bound by VGAM2808 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2808 host target proteins.

[39250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2808 gene, herein designated VGAM GENE, on one or more VGAM2808 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39251] It is yet further appreciated that a function of VGAM2808 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2808 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2808 correlate with, and may be deduced from, the identity of the host target genes which VGAM2808 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39252] Nucleotide sequences of the VGAM2808 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2808 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2808 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2808 are further described hereinbelow with reference to Table 1.

[39253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2808 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39254] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2809 (VGAM2809) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39255] VGAM2809 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2809 was detected is described hereinabove with reference to Figs. 2-8.

[39256] VGAM2809 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM2809 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39257] VGAM2809 gene, herein designated VGAM GENE, encodes a VGAM2809 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2809 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2809 precursor RNA is designated SEQ ID:2499, and is provided hereinbelow with reference to the sequence listing part.

[39258] VGAM2809 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39259] An enzyme complex designated DICER COMPLEX, dices the VGAM2809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2809 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2809 RNA is designated SEQ ID:5569, and is provided hereinbelow with reference to the sequence listing part.

[39260] VGAM2809 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2809 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2809 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39261] VGAM2809 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2809 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2809 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2809 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2809 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39262] The complementary binding of VGAM2809 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2809 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2809 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2809 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39263] It is appreciated that VGAM2809 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2809 host target genes. The mRNA of each one of this plurality of VGAM2809 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2809 RNA, herein designated VGAM RNA, and which when bound by VGAM2809 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2809 host target proteins.

[39264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2809 gene, herein designated VGAM GENE, on one or more VGAM2809 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39265] It is yet further appreciated that a function of VGAM2809 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2809 include diagnosis, prevention and

treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2809 correlate with, and may be deduced from, the identity of the host target genes which VGAM2809 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39266] Nucleotide sequences of the VGAM2809 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2809 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2809 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2809 are further described hereinbelow with reference to Table 1.

[39267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2809 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39268] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2810 (VGAM2810) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39269] VGAM2810 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2810 was detected is described hereinabove with reference to Figs. 2-8.

[39270] VGAM2810 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2810 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39271] VGAM2810 gene, herein designated VGAM GENE, encodes a VGAM2810 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2810 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2810 precursor RNA is designated SEQ ID:2504, and is provided hereinbelow with reference to the sequence listing part.

[39272] VGAM2810 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2810 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39273] An enzyme complex designated DICER COMPLEX, dices the VGAM2810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2810 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2810 RNA is designated SEQ ID:5574, and is provided hereinbelow with reference to the sequence listing part.

[39274] VGAM2810 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2810 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2810 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39275] VGAM2810 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2810 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2810 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2810 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2810 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39276] The complementary binding of VGAM2810 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2810 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2810 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2810 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39277] It is appreciated that VGAM2810 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2810 host target genes. The mRNA of each one of this plurality of VGAM2810 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2810 RNA, herein designated VGAM RNA, and which when bound by VGAM2810 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2810 host target proteins.

[39278] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2810 gene, herein designated VGAM GENE, on one or more VGAM2810 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39279] It is yet further appreciated that a function of VGAM2810 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2810 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM2810 correlate with, and may be deduced from, the identity of the host target genes which VGAM2810 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39280] Nucleotide sequences of the VGAM2810 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2810 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2810 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2810 are further described hereinbelow with reference to Table 1.

[39281] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2810 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39282] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2811 (VGAM2811) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[39283] VGAM2811 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2811 was detected is described hereinabove with reference to Figs. 2-8.

[39284] VGAM2811 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM2811 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39285] VGAM2811 gene, herein designated VGAM GENE, encodes a VGAM2811 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2811 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2811 precursor RNA is designated SEQ ID:2494, and is provided hereinbelow with reference to the sequence listing part.

[39286] VGAM2811 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2811 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39287] An enzyme complex designated DICER COMPLEX, dices the VGAM2811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2811 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2811 RNA is designated SEQ ID:5564, and is provided hereinbelow with reference to the sequence listing part.

[39288] VGAM2811 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2811 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2811 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39289] VGAM2811 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2811 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2811 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2811 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2811 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39290] The complementary binding of VGAM2811 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2811 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2811 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2811 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39291] It is appreciated that VGAM2811 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2811 host target genes. The mRNA of each one of this plurality of VGAM2811 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2811 RNA, herein designated VGAM RNA, and which when bound by VGAM2811 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2811 host target proteins.

[39292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2811 gene, herein designated VGAM GENE, on one or more VGAM2811 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39293] It is yet further appreciated that a function of VGAM2811 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2811 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM2811

correlate with, and may be deduced from, the identity of the host target genes which VGAM2811 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39294] Nucleotide sequences of the VGAM2811 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2811 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2811 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2811 are further described hereinbelow with reference to Table 1.

[39295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2811 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39296] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2812 (VGAM2812) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[39297] VGAM2812 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2812 was detected is described hereinabove with reference to Figs. 2-8.

[39298] VGAM2812 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM2812 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39299] VGAM2812 gene, herein designated VGAM GENE, encodes a VGAM2812 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2812 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2812 precursor RNA is designated SEQ ID:2509, and is provided hereinbelow with reference to the sequence listing part.

[39300] VGAM2812 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39301] An enzyme complex designated DICER COMPLEX, dices the VGAM2812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2812 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2812 RNA is designated SEQ ID:5579, and is provided hereinbelow with reference to the sequence listing part.

[39302] VGAM2812 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39303] VGAM2812 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2812 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2812 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39304] The complementary binding of VGAM2812 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2812 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2812 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39305] It is appreciated that VGAM2812 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2812 host target genes. The mRNA of each one of this plurality of VGAM2812 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2812 RNA, herein designated VGAM RNA, and which when bound by VGAM2812 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2812 host target proteins.

[39306] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2812 gene, herein designated VGAM GENE, on one or more VGAM2812 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39307] It is yet further appreciated that a function of VGAM2812 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2812 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM2812 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2812 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39308] Nucleotide sequences of the VGAM2812 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2812 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2812 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2812 are further described hereinbelow with reference to Table 1.

[39309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2812 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39310] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2813 (VGAM2813) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39311] VGAM2813 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2813 was detected is described hereinabove with reference to Figs. 2-8.

[39312] VGAM2813 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM2813 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39313] VGAM2813 gene, herein designated VGAM GENE, encodes a VGAM2813 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2813 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2813 precursor RNA is designated SEQ ID:2495, and is provided hereinbelow with reference to the sequence listing part.

[39314] VGAM2813 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39315] An enzyme complex designated DICER COMPLEX, dices the VGAM2813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2813 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2813 RNA is designated SEQ ID:5565, and is provided hereinbelow with reference to the sequence listing part.

[39316] VGAM2813 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39317] VGAM2813 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2813 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2813 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39318] The complementary binding of VGAM2813 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2813 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2813 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39319] It is appreciated that VGAM2813 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2813 host target genes. The mRNA of each one of this plurality of VGAM2813 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2813 RNA, herein designated VGAM RNA, and which when bound by VGAM2813 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2813 host target proteins.

[39320] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2813 gene, herein designated VGAM GENE, on one or more VGAM2813 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39321] It is yet further appreciated that a function of VGAM2813 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2813 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM2813 correlate with, and may be deduced from, the identity of the host target genes which VGAM2813 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[39322] Nucleotide sequences of the VGAM2813 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2813 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2813 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2813 are further described hereinbelow with reference to Table 1.

[39323] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2813 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39324] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2814 (VGAM2814) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39325] VGAM2814 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2814 was detected is described hereinabove with reference to Figs. 2-8.

[39326] VGAM2814 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM2814 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39327] VGAM2814 gene, herein designated VGAM GENE, encodes a VGAM2814 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2814 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2814 precursor RNA is designated SEQ ID:2496, and is provided hereinbelow with reference to the sequence listing part.

[39328] VGAM2814 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39329] An enzyme complex designated DICER COMPLEX, dices the VGAM2814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2814 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2814 RNA is designated SEQ ID:5566, and is provided hereinbelow with reference to the sequence listing part.

[39330] VGAM2814 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39331] VGAM2814 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2814 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2814 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[39332] The complementary binding of VGAM2814 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2814 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2814 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39333] It is appreciated that VGAM2814 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2814 host target genes. The mRNA of each one of this plurality of VGAM2814 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2814 RNA, herein designated VGAM RNA, and which when bound by VGAM2814 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2814 host target proteins.

[39334] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2814 gene, herein designated VGAM GENE, on one or more VGAM2814 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39335] It is yet further appreciated that a function of VGAM2814 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2814 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM2814 correlate with, and may be deduced from, the identity of the host target genes which VGAM2814 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[39336] Nucleotide sequences of the VGAM2814 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2814 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2814 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2814 are further described hereinbelow with reference to Table 1.

[39337] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2814 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39338] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2815 (VGAM2815) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39339] VGAM2815 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2815 was detected is described hereinabove with reference to Figs. 2-8.

[39340] VGAM2815 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM2815 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39341] VGAM2815 gene, herein designated VGAM GENE, encodes a VGAM2815 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2815 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2815 precursor RNA is designated SEQ ID:2500, and is provided hereinbelow with reference to the sequence listing part.

[39342] VGAM2815 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39343] An enzyme complex designated DICER COMPLEX, dices the VGAM2815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2815 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2815 RNA is designated SEQ ID:5570, and is provided hereinbelow with reference to the sequence listing part.

[39344] VGAM2815 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[39345] VGAM2815 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2815 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2815 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39346] The complementary binding of VGAM2815 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2815 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2815 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39347] It is appreciated that VGAM2815 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2815 host target genes. The mRNA of each one of this plurality of VGAM2815 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2815 RNA, herein designated VGAM RNA, and which when bound by VGAM2815 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2815 host target proteins.

[39348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2815 gene, herein designated VGAM GENE, on one

or more VGAM2815 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39349] It is yet further appreciated that a function of VGAM2815 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2815 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2815 correlate with, and may be deduced from, the identity of the host target genes which VGAM2815 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39350] Nucleotide sequences of the VGAM2815 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2815 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2815 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2815 are further described hereinbelow with reference to Table 1.

[39351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2815 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39352] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2816 (VGAM2816) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39353] VGAM2816 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2816 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[39354] VGAM2816 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 49. VGAM2816 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39355] VGAM2816 gene, herein designated VGAM GENE, encodes a VGAM2816 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2816 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2816 precursor RNA is designated SEQ ID:2505, and is provided hereinbelow with reference to the sequence listing part.

[39356] VGAM2816 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39357] An enzyme complex designated DICER COMPLEX, dices the VGAM2816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2816 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2816 RNA is designated SEQ ID:5575, and is provided hereinbelow with reference to the sequence listing part.

[39358] VGAM2816 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39359] VGAM2816 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2816 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2816 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39360] The complementary binding of VGAM2816 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2816 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2816 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39361] It is appreciated that VGAM2816 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2816 host target genes. The mRNA of each one of this plurality of VGAM2816 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2816 RNA, herein designated VGAM RNA, and which when bound by VGAM2816 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2816 host target proteins.

[39362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2816 gene, herein designated VGAM GENE, on one or more VGAM2816 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39363] It is yet further appreciated that a function of VGAM2816 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2816 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 49. Specific functions, and accordingly utilities, of VGAM2816 correlate with, and may be deduced from, the identity of the host target genes which VGAM2816 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39364] Nucleotide sequences of the VGAM2816 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2816 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2816 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2816 are further described hereinbelow with reference to Table 1.

[39365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2816 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39366] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2817 (VGAM2817) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39367] VGAM2817 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2817 was detected is described hereinabove with reference to Figs. 2-8.

[39368] VGAM2817 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory syncytial virus. VGAM2817 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39369] VGAM2817 gene, herein designated VGAM GENE, encodes a VGAM2817 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2817 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2817 precursor RNA is designated SEQ ID:2510, and is provided hereinbelow with reference to the sequence listing part.

[39370] VGAM2817 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[39371] An enzyme complex designated DICER COMPLEX, dices the VGAM2817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2817 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2817 RNA is designated SEQ ID:5580, and is provided hereinbelow with reference to the sequence listing part.

[39372] VGAM2817 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39373] VGAM2817 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2817 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2817 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39374] The complementary binding of VGAM2817 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2817 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2817 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39375] It is appreciated that VGAM2817 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2817 host target genes. The mRNA of each one of this plurality of VGAM2817 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2817 RNA, herein designated VGAM RNA, and which when bound by VGAM2817 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2817 host target proteins.

[39376] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2817 gene, herein designated VGAM GENE, on one or more VGAM2817 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39377] It is yet further appreciated that a function of VGAM2817 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2817 include diagnosis, prevention and treatment of viral infection by Respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM2817 correlate with, and may be deduced from, the identity of the host target genes which VGAM2817 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39378] Nucleotide sequences of the VGAM2817 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2817 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2817 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2817 are further described hereinbelow with reference to Table 1.

[39379] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2817 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39380] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2818 (VGAM2818) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39381] VGAM2818 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2818 was detected is described hereinabove with reference to Figs. 2-8.

[39382] VGAM2818 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tupaia herpesvirus. VGAM2818 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39383] VGAM2818 gene, herein designated VGAM GENE, encodes a VGAM2818 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2818 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2818 precursor RNA is designated SEQ ID:2497, and is provided hereinbelow with reference to the sequence listing part.

[39384] VGAM2818 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39385] An enzyme complex designated DICER COMPLEX, dices the VGAM2818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2818 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2818 RNA is designated SEQ ID:5567, and is provided hereinbelow with reference to the sequence listing part.

[39386] VGAM2818 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2818 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2818 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39387] VGAM2818 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2818 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2818 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2818 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2818 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39388] The complementary binding of VGAM2818 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2818 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2818 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2818 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39389] It is appreciated that VGAM2818 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2818 host target genes. The mRNA of each one of this plurality of VGAM2818 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2818 RNA, herein designated VGAM RNA, and which when bound by VGAM2818 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2818 host target proteins.

[39390] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2818 gene, herein designated VGAM GENE, on one or more VGAM2818 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39391] It is yet further appreciated that a function of VGAM2818 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2818 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2818 correlate with, and may be deduced from, the identity of the host target genes which VGAM2818 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39392] Nucleotide sequences of the VGAM2818 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2818 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2818 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2818 are further described hereinbelow with reference to Table 1.

[39393] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2818 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39394] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2819 (VGAM2819) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39395] VGAM2819 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2819 was detected is described hereinabove with reference to Figs. 2-8.

[39396] VGAM2819 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine polyomavirus.

VGAM2819 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39397] VGAM2819 gene, herein designated VGAM GENE, encodes a VGAM2819 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2819 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2819 precursor RNA is designated SEQ ID:2501, and is provided hereinbelow with reference to the sequence listing part.

[39398] VGAM2819 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39399] An enzyme complex designated DICER COMPLEX, dices

the VGAM2819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2819 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2819 RNA is designated SEQ ID:5571, and is provided hereinbelow with reference to the sequence listing part.

[39400] VGAM2819 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2819 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2819 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39401] VGAM2819 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2819 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2819 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2819 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2819 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39402] The complementary binding of VGAM2819 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2819 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2819 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2819 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39403] It is appreciated that VGAM2819 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2819 host target genes. The mRNA of each one of this plurality of VGAM2819 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2819 RNA, herein designated VGAM RNA, and which when bound by VGAM2819 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2819 host target proteins.

[39404] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2819 gene, herein designated VGAM GENE, on one or more VGAM2819 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39405] It is yet further appreciated that a function of VGAM2819 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2819 include diagnosis, prevention and treatment of viral infection by Bovine polyomavirus. Specific functions, and accordingly utilities, of VGAM2819 correlate with, and may be deduced from, the identity of the host target genes which VGAM2819 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39406] Nucleotide sequences of the VGAM2819 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2819 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2819 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2819 are further described hereinbelow with reference to Table 1.

[39407] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2819 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39408] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2820 (VGAM2820) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39409] VGAM2820 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2820 was detected is described hereinabove with reference to Figs. 2-8.

[39410] VGAM2820 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM2820 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[39411] VGAM2820 gene, herein designated VGAM GENE, encodes a VGAM2820 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2820 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2820 precursor RNA is designated SEQ ID:2506, and is provided hereinbelow with reference to the sequence listing part.

[39412] VGAM2820 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2820 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39413] An enzyme complex designated DICER COMPLEX, dices the VGAM2820 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2820 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2820 RNA is designated SEQ ID:5576, and is provided hereinbelow with reference to the sequence listing part.

[39414] VGAM2820 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2820 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2820 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39415] VGAM2820 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2820 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2820 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2820 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2820 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39416] The complementary binding of VGAM2820 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2820 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2820

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2820 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39417] It is appreciated that VGAM2820 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2820 host target genes. The mRNA of each one of this plurality of VGAM2820 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2820 RNA, herein designated VGAM RNA, and which when bound by VGAM2820 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2820 host target proteins.

[39418] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2820 gene, herein designated VGAM GENE, on one or more VGAM2820 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39419] It is yet further appreciated that a function of VGAM2820 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2820 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2820 correlate with, and may be deduced from, the identity of the host target genes which VGAM2820 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39420] Nucleotide sequences of the VGAM2820 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2820 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2820 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2820 are further described hereinbelow with reference to Table 1.

[39421] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2820 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39422] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2821 (VGAM2821) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39423] VGAM2821 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2821 was detected is described hereinabove with reference to Figs. 2-8.

[39424] VGAM2821 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2821 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[39425] VGAM2821 gene, herein designated VGAM GENE, encodes a VGAM2821 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2821 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2821 precursor RNA is designated SEQ ID:2511, and is provided hereinbelow with reference to the sequence listing part.

[39426] VGAM2821 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39427] An enzyme complex designated DICER COMPLEX, dices the VGAM2821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2821 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2821 RNA is designated SEQ ID:5581, and is provided hereinbelow with reference to the sequence listing part.

[39428] VGAM2821 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2821 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2821 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39429] VGAM2821 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2821 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2821 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2821 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2821 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39430] The complementary binding of VGAM2821 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2821 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2821 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2821 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39431] It is appreciated that VGAM2821 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2821 host target genes. The mRNA of each one of this plurality of VGAM2821 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2821 RNA, herein designated VGAM RNA, and which when bound by VGAM2821 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2821 host target proteins.

[39432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2821 gene, herein designated VGAM GENE, on one or more VGAM2821 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39433] It is yet further appreciated that a function of VGAM2821 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2821 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2821 correlate with, and may be deduced from, the identity of the host target genes which VGAM2821 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39434] Nucleotide sequences of the VGAM2821 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2821 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2821 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2821 are further

described hereinbelow with reference to Table 1.

[39435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2821 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39436] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2822 (VGAM2822) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39437] VGAM2822 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2822 was detected is described hereinabove with reference to Figs. 2-8.

[39438] VGAM2822 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM2822 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39439] VGAM2822 gene, herein designated VGAM GENE, encodes a VGAM2822 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2822 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2822 precursor RNA is designated SEQ ID:2512, and is provided hereinbelow with reference to the sequence listing part.

[39440] VGAM2822 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39441] An enzyme complex designated DICER COMPLEX, dices the VGAM2822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2822 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2822 RNA is designated SEQ ID:5582, and is provided hereinbelow with reference to the sequence listing part.

[39442] VGAM2822 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39443] VGAM2822 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2822 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2822 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39444] The complementary binding of VGAM2822 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2822 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2822 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39445] It is appreciated that VGAM2822 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2822 host target genes. The mRNA of each one of this plurality of VGAM2822 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2822 RNA, herein designated VGAM RNA, and which when bound by VGAM2822 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2822 host target proteins.

[39446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2822 gene, herein designated VGAM GENE, on one or more VGAM2822 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39447] It is yet further appreciated that a function of VGAM2822 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2822 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2822 correlate with, and may be deduced from, the identity of the host target genes which VGAM2822 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39448] Nucleotide sequences of the VGAM2822 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2822 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2822 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2822 are further described hereinbelow with reference to Table 1.

[39449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2822 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39450] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2823 (VGAM2823) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39451] VGAM2823 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2823 was detected is described hereinabove with reference to Figs. 2-8.

[39452] VGAM2823 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus sanguinipes entomopoxvirus. VGAM2823 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39453] VGAM2823 gene, herein designated VGAM GENE, encodes

a VGAM2823 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2823 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2823 precursor RNA is designated SEQ ID:2515, and is provided hereinbelow with reference to the sequence listing part.

[39454] VGAM2823 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39455] An enzyme complex designated DICER COMPLEX, dices the VGAM2823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2823 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2823 RNA is designated SEQ ID:5585, and is provided hereinbelow with reference to the sequence listing part.

[39456] VGAM2823 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39457] VGAM2823 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2823 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2823 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39458] The complementary binding of VGAM2823 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2823 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2823 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[39459] It is appreciated that VGAM2823 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2823 host target genes. The mRNA of each one of this plurality of VGAM2823 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2823 RNA, herein designated VGAM RNA, and which when bound by VGAM2823 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2823 host target proteins.

[39460] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2823 gene, herein designated VGAM GENE, on one or more VGAM2823 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39461] It is yet further appreciated that a function of VGAM2823 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2823 include diagnosis, prevention and treatment of viral infection by Melanoplus sanguinipes entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2823 correlate with, and may be deduced from, the identity of the host target genes which VGAM2823 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39462] Nucleotide sequences of the VGAM2823 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2823 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2823 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2823 are further described hereinbelow with reference to Table 1.

[39463] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2823 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39464] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2824 (VGAM2824) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39465] VGAM2824 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2824 was detected is described hereinabove with reference to Figs. 2-8.

[39466] VGAM2824 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine epidemic diarrhea virus. VGAM2824 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39467] VGAM2824 gene, herein designated VGAM GENE, encodes a VGAM2824 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2824 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2824 precursor RNA is designated SEQ ID:2513, and is provided hereinbelow with reference to the sequence listing part.

[39468] VGAM2824 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39469] An enzyme complex designated DICER COMPLEX, dices the VGAM2824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2824 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2824 RNA is designated SEQ ID:5583, and is provided hereinbelow with reference to the sequence listing part.

[39470] VGAM2824 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39471] VGAM2824 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2824 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2824 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39472] The complementary binding of VGAM2824 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2824 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2824 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39473] It is appreciated that VGAM2824 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2824 host target genes. The mRNA of each one of this plurality of VGAM2824 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2824 RNA, herein designated VGAM RNA, and which when bound by VGAM2824 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2824 host target proteins.

[39474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2824 gene, herein designated VGAM GENE, on one or more VGAM2824 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39475] It is yet further appreciated that a function of VGAM2824 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2824 include diagnosis, prevention and treatment of viral infection by Porcine epidemic diarrhea virus. Specific functions, and accordingly utilities, of VGAM2824 correlate with, and may be deduced from, the identity of the host target genes which VGAM2824 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39476] Nucleotide sequences of the VGAM2824 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2824 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2824 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2824 are further described hereinbelow with reference to Table 1.

[39477] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2824 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39478] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2825 (VGAM2825) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39479] VGAM2825 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2825 was detected is described hereinabove with reference to Figs. 2-8.

[39480] VGAM2825 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum pox virus. VGAM2825 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39481] VGAM2825 gene, herein designated VGAM GENE, encodes a VGAM2825 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2825 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2825 precursor RNA is designated SEQ ID:2514, and is provided hereinbelow with reference to the sequence listing part.

[39482] VGAM2825 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39483] An enzyme complex designated DICER COMPLEX, dices the VGAM2825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2825 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2825 RNA is designated SEQ ID:5584, and is provided hereinbelow with reference to the sequence listing part.

[39484] VGAM2825 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39485] VGAM2825 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2825 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2825 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39486] The complementary binding of VGAM2825 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2825 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2825 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39487] It is appreciated that VGAM2825 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2825 host target genes. The mRNA of each one of this plurality of VGAM2825 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2825 RNA, herein designated VGAM RNA, and which when bound by VGAM2825 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2825 host target proteins.

[39488] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2825 gene, herein designated VGAM GENE, on one or more VGAM2825 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39489] It is yet further appreciated that a function of VGAM2825 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2825 include diagnosis, prevention and treatment of viral infection by Plum pox virus. Specific functions, and accordingly utilities, of VGAM2825 correlate with, and may be deduced from, the identity of the host target genes which VGAM2825 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39490] Nucleotide sequences of the VGAM2825 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2825 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2825 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2825 are further described hereinbelow with reference to Table 1.

[39491] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2825 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39492] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2826 (VGAM2826) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39493] VGAM2826 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2826 was detected is described hereinabove with reference to Figs. 2-8.

[39494] VGAM2826 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2826 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39495] VGAM2826 gene, herein designated VGAM GENE, encodes a VGAM2826 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2826 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2826 precursor RNA is designated SEQ ID:2507, and is provided hereinbelow with reference to the sequence listing part.

[39496] VGAM2826 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39497] An enzyme complex designated DICER COMPLEX, dices the VGAM2826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2826 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2826 RNA is designated SEQ ID:5577, and is provided hereinbelow with reference to the sequence listing part.

[39498] VGAM2826 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39499] VGAM2826 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2826 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2826 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39500] The complementary binding of VGAM2826 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2826 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2826 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39501] It is appreciated that VGAM2826 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2826 host target genes. The mRNA of each one of this plurality of VGAM2826 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2826 RNA, herein designated VGAM RNA, and which when bound by VGAM2826 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2826 host target proteins.

[39502] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2826 gene, herein designated VGAM GENE, on one or more VGAM2826 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39503] It is yet further appreciated that a function of VGAM2826 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2826 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2826 correlate with, and may be deduced from, the identity of the host target genes which VGAM2826 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39504] Nucleotide sequences of the VGAM2826 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2826 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2826 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2826 are further described hereinbelow with reference to Table 1.

[39505] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2826 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39506] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2827 (VGAM2827) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39507] VGAM2827 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2827 was detected is described hereinabove with reference to Figs. 2-8.

[39508] VGAM2827 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit fibroma virus. VGAM2827 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39509] VGAM2827 gene, herein designated VGAM GENE, encodes a VGAM2827 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2827 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2827 precursor RNA is designated SEQ ID:2508, and is provided hereinbelow with reference to the sequence listing part.

[39510] VGAM2827 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39511] An enzyme complex designated DICER COMPLEX, dices the VGAM2827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2827 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2827 RNA is designated SEQ ID:5578, and is provided hereinbelow with reference to the sequence listing part.

[39512] VGAM2827 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39513] VGAM2827 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2827 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2827 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39514] The complementary binding of VGAM2827 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2827 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2827 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39515] It is appreciated that VGAM2827 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2827 host target genes. The mRNA of

each one of this plurality of VGAM2827 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2827 RNA, herein designated VGAM RNA, and which when bound by VGAM2827 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2827 host target proteins.

[39516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2827 gene, herein designated VGAM GENE, on one or more VGAM2827 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[39517] It is yet further appreciated that a function of VGAM2827 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2827 include diagnosis, prevention and treatment of viral infection by Rabbit fibroma virus. Specific functions, and accordingly utilities, of VGAM2827 correlate with, and may be deduced from, the identity of the host target genes which VGAM2827 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39518] Nucleotide sequences of the VGAM2827 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2827 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2827 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2827 are further described hereinbelow with reference to Table 1.

[39519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2827 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[39520] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2828 (VGAM2828) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39521] VGAM2828 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2828 was detected is described hereinabove with reference to Figs. 2-8.

[39522] VGAM2828 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2828 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39523] VGAM2828 gene, herein designated VGAM GENE, encodes a VGAM2828 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2828 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2828 precursor RNA is designated SEQ ID:2516, and is provided hereinbelow with reference to the sequence listing part.

[39524] VGAM2828 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39525] An enzyme complex designated DICER COMPLEX, dices the VGAM2828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2828 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2828 RNA is designated SEQ ID:5586, and

is provided hereinbelow with reference to the sequence listing part.

[39526] VGAM2828 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39527] VGAM2828 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2828 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2828 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39528] The complementary binding of VGAM2828 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2828 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2828 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39529] It is appreciated that VGAM2828 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2828 host target genes. The mRNA of each one of this plurality of VGAM2828 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2828 RNA, herein designated VGAM RNA, and which when bound by VGAM2828 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2828 host target proteins.

[39530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2828 gene, herein designated VGAM GENE, on one or more VGAM2828 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39531] It is yet further appreciated that a function of VGAM2828 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2828 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2828 correlate with, and may be deduced from, the identity of the host target genes which VGAM2828 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39532] Nucleotide sequences of the VGAM2828 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2828 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2828 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2828 are further described hereinbelow with reference to Table 1.

[39533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2828 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39534] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2829 (VGAM2829) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39535] VGAM2829 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2829 was detected is described hereinabove with reference to Figs. 2-8.

[39536] VGAM2829 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2829 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39537] VGAM2829 gene, herein designated VGAM GENE, encodes a VGAM2829 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2829 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2829 precur-

sor RNA is designated SEQ ID:2521, and is provided hereinbelow with reference to the sequence listing part.

[39538] VGAM2829 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39539] An enzyme complex designated DICER COMPLEX, dices the VGAM2829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2829 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2829 RNA is designated SEQ ID:5591, and is provided hereinbelow with reference to the sequence

listing part.

[39540] VGAM2829 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39541] VGAM2829 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2829 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2829 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39542] The complementary binding of VGAM2829 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2829 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2829 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39543] It is appreciated that VGAM2829 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2829 host target genes. The mRNA of each one of this plurality of VGAM2829 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2829 RNA, herein designated VGAM RNA, and which when bound by VGAM2829 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2829 host target proteins.

[39544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2829 gene, herein designated VGAM GENE, on one or more VGAM2829 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39545] It is yet further appreciated that a function of VGAM2829

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2829 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2829 correlate with, and may be deduced from, the identity of the host target genes which VGAM2829 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39546] Nucleotide sequences of the VGAM2829 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2829 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2829 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2829 are further described hereinbelow with reference to Table 1.

[39547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2829 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39548] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2830 (VGAM2830) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39549] VGAM2830 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2830 was detected is described hereinabove with reference to Figs. 2-8.

[39550] VGAM2830 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus A. VGAM2830 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39551] VGAM2830 gene, herein designated VGAM GENE, encodes a VGAM2830 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2830 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2830 precursor RNA is designated SEQ ID:2517, and is provided here-

inbelow with reference to the sequence listing part.

[39552] VGAM2830 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39553] An enzyme complex designated DICER COMPLEX, dices the VGAM2830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2830 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2830 RNA is designated SEQ ID:5587, and is provided hereinbelow with reference to the sequence listing part.

[39554] VGAM2830 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39555] VGAM2830 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2830 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2830 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39556] The complementary binding of VGAM2830 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2830 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2830 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39557] It is appreciated that VGAM2830 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2830 host target genes. The mRNA of each one of this plurality of VGAM2830 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2830 RNA, herein designated VGAM RNA, and which when bound by VGAM2830 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2830 host target proteins.

[39558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2830 gene, herein designated VGAM GENE, on one or more VGAM2830 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39559] It is yet further appreciated that a function of VGAM2830 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2830 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus A. Specific functions, and accordingly utilities, of VGAM2830 correlate with, and may be deduced from, the identity of the host target genes which VGAM2830 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39560] Nucleotide sequences of the VGAM2830 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2830 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2830 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2830 are further described hereinbelow with reference to Table 1.

[39561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2830 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39562] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2831 (VGAM2831) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39563] VGAM2831 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2831 was detected is described hereinabove with reference to Figs. 2-8.

[39564] VGAM2831 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM2831 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39565] VGAM2831 gene, herein designated VGAM GENE, encodes a VGAM2831 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2831 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2831 precursor RNA is designated SEQ ID:2518, and is provided hereinbelow with reference to the sequence listing part.

[39566] VGAM2831 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39567] An enzyme complex designated DICER COMPLEX, dices the VGAM2831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2831 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2831 RNA is designated SEQ ID:5588, and is provided hereinbelow with reference to the sequence listing part.

[39568] VGAM2831 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39569] VGAM2831 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2831 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2831 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39570] The complementary binding of VGAM2831 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2831 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2831 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39571] It is appreciated that VGAM2831 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2831 host target genes. The mRNA of each one of this plurality of VGAM2831 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2831 RNA, herein designated VGAM

RNA, and which when bound by VGAM2831 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2831 host target proteins.

[39572] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2831 gene, herein designated VGAM GENE, on one or more VGAM2831 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39573] It is yet further appreciated that a function of VGAM2831 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2831 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2831 correlate with, and may be deduced from, the identity of the host target genes which VGAM2831 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39574] Nucleotide sequences of the VGAM2831 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2831 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2831 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2831 are further described hereinbelow with reference to Table 1.

[39575] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2831 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39576] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2832 (VGAM2832) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39577] VGAM2832 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2832 was detected is described hereinabove with reference to Figs. 2-8.

[39578] VGAM2832 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM2832 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39579] VGAM2832 gene, herein designated VGAM GENE, encodes a VGAM2832 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2832 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2832 precursor RNA is designated SEQ ID:2528, and is provided hereinbelow with reference to the sequence listing part.

[39580] VGAM2832 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39581] An enzyme complex designated DICER COMPLEX, dices the VGAM2832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2832 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2832 RNA is designated SEQ ID:5598, and is provided hereinbelow with reference to the sequence listing part.

[39582] VGAM2832 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2832 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2832 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39583] VGAM2832 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2832 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2832 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2832 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2832 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39584] The complementary binding of VGAM2832 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2832 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2832 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2832 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39585] It is appreciated that VGAM2832 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2832 host target genes. The mRNA of each one of this plurality of VGAM2832 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2832 RNA, herein designated VGAM RNA, and which when bound by VGAM2832 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2832 host target proteins.

[39586] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2832 gene, herein designated VGAM GENE, on one or more VGAM2832 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39587] It is yet further appreciated that a function of VGAM2832 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2832 include diagnosis, prevention and

treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM2832 correlate with, and may be deduced from, the identity of the host target genes which VGAM2832 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39588] Nucleotide sequences of the VGAM2832 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2832 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2832 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2832 are further described hereinbelow with reference to Table 1.

[39589] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2832 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39590] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2833 (VGAM2833) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39591] VGAM2833 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2833 was detected is described hereinabove with reference to Figs. 2-8.

[39592] VGAM2833 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2833 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39593] VGAM2833 gene, herein designated VGAM GENE, encodes a VGAM2833 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2833 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2833 precursor RNA is designated SEQ ID:2519, and is provided hereinbelow with reference to the sequence listing part.

[39594] VGAM2833 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2833 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39595] An enzyme complex designated DICER COMPLEX, dices the VGAM2833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2833 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2833 RNA is designated SEQ ID:5589, and is provided hereinbelow with reference to the sequence listing part.

[39596] VGAM2833 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2833 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2833 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39597] VGAM2833 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2833 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2833 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2833 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2833 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39598] The complementary binding of VGAM2833 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2833 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2833 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2833 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39599] It is appreciated that VGAM2833 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2833 host target genes. The mRNA of each one of this plurality of VGAM2833 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2833 RNA, herein designated VGAM RNA, and which when bound by VGAM2833 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2833 host target proteins.

[39600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2833 gene, herein designated VGAM GENE, on one or more VGAM2833 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39601] It is yet further appreciated that a function of VGAM2833 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2833 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM2833 correlate with, and may be deduced from, the identity of the host target genes which VGAM2833 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39602] Nucleotide sequences of the VGAM2833 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2833 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2833 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2833 are further described hereinbelow with reference to Table 1.

[39603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2833 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39604] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2834 (VGAM2834) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[39605] VGAM2834 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2834 was detected is described hereinabove with reference to Figs. 2-8.

[39606] VGAM2834 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turnip mosaic virus. VGAM2834 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39607] VGAM2834 gene, herein designated VGAM GENE, encodes a VGAM2834 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2834 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2834 precursor RNA is designated SEQ ID:2522, and is provided hereinbelow with reference to the sequence listing part.

[39608] VGAM2834 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2834 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39609] An enzyme complex designated DICER COMPLEX, dices the VGAM2834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2834 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2834 RNA is designated SEQ ID:5592, and is provided hereinbelow with reference to the sequence listing part.

[39610] VGAM2834 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2834 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2834 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39611] VGAM2834 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2834 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2834 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2834 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2834 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39612] The complementary binding of VGAM2834 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2834 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2834 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2834 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39613] It is appreciated that VGAM2834 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2834 host target genes. The mRNA of each one of this plurality of VGAM2834 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2834 RNA, herein designated VGAM RNA, and which when bound by VGAM2834 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2834 host target proteins.

[39614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2834 gene, herein designated VGAM GENE, on one or more VGAM2834 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39615] It is yet further appreciated that a function of VGAM2834 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2834 include diagnosis, prevention and treatment of viral infection by Turnip mosaic virus. Specific functions, and accordingly utilities, of VGAM2834

correlate with, and may be deduced from, the identity of the host target genes which VGAM2834 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39616] Nucleotide sequences of the VGAM2834 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2834 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2834 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2834 are further described hereinbelow with reference to Table 1.

[39617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2834 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39618] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2835 (VGAM2835) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[39619] VGAM2835 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2835 was detected is described hereinabove with reference to Figs. 2-8.

[39620] VGAM2835 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine parvovirus. VGAM2835 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39621] VGAM2835 gene, herein designated VGAM GENE, encodes a VGAM2835 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2835 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2835 precursor RNA is designated SEQ ID:2523, and is provided hereinbelow with reference to the sequence listing part.

[39622] VGAM2835 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39623] An enzyme complex designated DICER COMPLEX, dices the VGAM2835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2835 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2835 RNA is designated SEQ ID:5593, and is provided hereinbelow with reference to the sequence listing part.

[39624] VGAM2835 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39625] VGAM2835 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2835 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2835 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39626] The complementary binding of VGAM2835 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2835 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2835 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39627] It is appreciated that VGAM2835 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2835 host target genes. The mRNA of each one of this plurality of VGAM2835 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2835 RNA, herein designated VGAM RNA, and which when bound by VGAM2835 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2835 host target proteins.

[39628] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2835 gene, herein designated VGAM GENE, on one or more VGAM2835 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39629] It is yet further appreciated that a function of VGAM2835 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2835 include diagnosis, prevention and treatment of viral infection by Bovine parvovirus. Specific functions, and accordingly utilities, of VGAM2835 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2835 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39630] Nucleotide sequences of the VGAM2835 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2835 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2835 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2835 are further described hereinbelow with reference to Table 1.

[39631] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2835 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39632] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2836 (VGAM2836) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39633] VGAM2836 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2836 was detected is described hereinabove with reference to Figs. 2-8.

[39634] VGAM2836 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lettuce mosaic virus. VGAM2836 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39635] VGAM2836 gene, herein designated VGAM GENE, encodes a VGAM2836 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2836 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2836 precursor RNA is designated SEQ ID:2520, and is provided hereinbelow with reference to the sequence listing part.

[39636] VGAM2836 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39637] An enzyme complex designated DICER COMPLEX, dices the VGAM2836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2836 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2836 RNA is designated SEQ ID:5590, and is provided hereinbelow with reference to the sequence listing part.

[39638] VGAM2836 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39639] VGAM2836 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2836 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2836 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39640] The complementary binding of VGAM2836 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2836 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2836 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39641] It is appreciated that VGAM2836 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2836 host target genes. The mRNA of each one of this plurality of VGAM2836 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2836 RNA, herein designated VGAM RNA, and which when bound by VGAM2836 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2836 host target proteins.

[39642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2836 gene, herein designated VGAM GENE, on one or more VGAM2836 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39643] It is yet further appreciated that a function of VGAM2836 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2836 include diagnosis, prevention and treatment of viral infection by Lettuce mosaic virus. Specific functions, and accordingly utilities, of VGAM2836 correlate with, and may be deduced from, the identity of the host target genes which VGAM2836 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[39644] Nucleotide sequences of the VGAM2836 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2836 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2836 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2836 are further described hereinbelow with reference to Table 1.

[39645] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2836 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39646] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2837 (VGAM2837) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39647] VGAM2837 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2837 was detected is described hereinabove with reference to Figs. 2-8.

[39648] VGAM2837 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2837 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39649] VGAM2837 gene, herein designated VGAM GENE, encodes a VGAM2837 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2837 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2837 precursor RNA is designated SEQ ID:2524, and is provided hereinbelow with reference to the sequence listing part.

[39650] VGAM2837 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39651] An enzyme complex designated DICER COMPLEX, dices the VGAM2837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2837 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2837 RNA is designated SEQ ID:5594, and is provided hereinbelow with reference to the sequence listing part.

[39652] VGAM2837 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39653] VGAM2837 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2837 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2837 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[39654] The complementary binding of VGAM2837 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2837 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2837 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39655] It is appreciated that VGAM2837 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2837 host target genes. The mRNA of each one of this plurality of VGAM2837 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2837 RNA, herein designated VGAM RNA, and which when bound by VGAM2837 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2837 host target proteins.

[39656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2837 gene, herein designated VGAM GENE, on one or more VGAM2837 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39657] It is yet further appreciated that a function of VGAM2837 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2837 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2837 correlate with, and may be deduced from, the identity of the host target genes which VGAM2837 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[39658] Nucleotide sequences of the VGAM2837 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2837 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2837 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2837 are further described hereinbelow with reference to Table 1.

[39659] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2837 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39660] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2838 (VGAM2838) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39661] VGAM2838 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2838 was detected is described hereinabove with reference to Figs. 2-8.

[39662] VGAM2838 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2838 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39663] VGAM2838 gene, herein designated VGAM GENE, encodes a VGAM2838 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2838 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2838 precursor RNA is designated SEQ ID:2529, and is provided hereinbelow with reference to the sequence listing part.

[39664] VGAM2838 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39665] An enzyme complex designated DICER COMPLEX, dices the VGAM2838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2838 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2838 RNA is designated SEQ ID:5599, and is provided hereinbelow with reference to the sequence listing part.

[39666] VGAM2838 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[39667] VGAM2838 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2838 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2838 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39668] The complementary binding of VGAM2838 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2838 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2838 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39669] It is appreciated that VGAM2838 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2838 host target genes. The mRNA of each one of this plurality of VGAM2838 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2838 RNA, herein designated VGAM RNA, and which when bound by VGAM2838 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2838 host target proteins.

[39670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2838 gene, herein designated VGAM GENE, on one

or more VGAM2838 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39671] It is yet further appreciated that a function of VGAM2838 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2838 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2838 correlate with, and may be deduced from, the identity of the host target genes which VGAM2838 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39672] Nucleotide sequences of the VGAM2838 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2838 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2838 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2838 are further described hereinbelow with reference to Table 1.

[39673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2838 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39674] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2839 (VGAM2839) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39675] VGAM2839 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2839 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[39676] VGAM2839 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Scallion mosaic virus. VGAM2839 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39677] VGAM2839 gene, herein designated VGAM GENE, encodes a VGAM2839 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2839 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2839 precursor RNA is designated SEQ ID:2535, and is provided hereinbelow with reference to the sequence listing part.

[39678] VGAM2839 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39679] An enzyme complex designated DICER COMPLEX, dices the VGAM2839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2839 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2839 RNA is designated SEQ ID:5605, and is provided hereinbelow with reference to the sequence listing part.

[39680] VGAM2839 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39681] VGAM2839 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2839 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2839 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39682] The complementary binding of VGAM2839 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2839 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2839 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39683] It is appreciated that VGAM2839 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2839 host target genes. The mRNA of each one of this plurality of VGAM2839 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2839 RNA, herein designated VGAM RNA, and which when bound by VGAM2839 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2839 host target proteins.

[39684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2839 gene, herein designated VGAM GENE, on one or more VGAM2839 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39685] It is yet further appreciated that a function of VGAM2839 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2839 include diagnosis, prevention and treatment of viral infection by Scallion mosaic virus. Specific functions, and accordingly utilities, of VGAM2839 correlate with, and may be deduced from, the identity of the host target genes which VGAM2839 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39686] Nucleotide sequences of the VGAM2839 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2839 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2839 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2839 are further described hereinbelow with reference to Table 1.

[39687] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2839 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39688] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2840 (VGAM2840) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39689] VGAM2840 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2840 was detected is described hereinabove with reference to Figs. 2-8.

[39690] VGAM2840 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM2840 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39691] VGAM2840 gene, herein designated VGAM GENE, encodes a VGAM2840 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2840 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2840 precursor RNA is designated SEQ ID:2525, and is provided hereinbelow with reference to the sequence listing part.

[39692] VGAM2840 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[39693] An enzyme complex designated DICER COMPLEX, dices the VGAM2840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2840 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2840 RNA is designated SEQ ID:5595, and is provided hereinbelow with reference to the sequence listing part.

[39694] VGAM2840 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39695] VGAM2840 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2840 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2840 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39696] The complementary binding of VGAM2840 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2840 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2840 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39697] It is appreciated that VGAM2840 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2840 host target genes. The mRNA of each one of this plurality of VGAM2840 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2840 RNA, herein designated VGAM RNA, and which when bound by VGAM2840 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2840 host target proteins.

[39698] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2840 gene, herein designated VGAM GENE, on one or more VGAM2840 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39699] It is yet further appreciated that a function of VGAM2840 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2840 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Specific functions, and accordingly utilities, of VGAM2840 correlate with, and may be deduced from, the identity of the host target genes which VGAM2840 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39700] Nucleotide sequences of the VGAM2840 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2840 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2840 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2840 are further described hereinbelow with reference to Table 1.

[39701] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2840 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39702] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2841 (VGAM2841) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39703] VGAM2841 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2841 was detected is described hereinabove with reference to Figs. 2-8.

[39704] VGAM2841 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Camelpox virus. VGAM2841 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39705] VGAM2841 gene, herein designated VGAM GENE, encodes a VGAM2841 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2841 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2841 precursor RNA is designated SEQ ID:2536, and is provided hereinbelow with reference to the sequence listing part.

[39706] VGAM2841 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39707] An enzyme complex designated DICER COMPLEX, dices the VGAM2841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2841 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2841 RNA is designated SEQ ID:5606, and is provided hereinbelow with reference to the sequence listing part.

[39708] VGAM2841 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2841 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2841 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39709] VGAM2841 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2841 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2841 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2841 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2841 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39710] The complementary binding of VGAM2841 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2841 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2841 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2841 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39711] It is appreciated that VGAM2841 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2841 host target genes. The mRNA of each one of this plurality of VGAM2841 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2841 RNA, herein designated VGAM RNA, and which when bound by VGAM2841 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2841 host target proteins.

[39712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2841 gene, herein designated VGAM GENE, on one or more VGAM2841 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39713] It is yet further appreciated that a function of VGAM2841 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2841 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2841 correlate with, and may be deduced from, the identity of the host target genes which VGAM2841 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39714] Nucleotide sequences of the VGAM2841 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2841 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2841 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2841 are further described hereinbelow with reference to Table 1.

[39715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2841 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39716] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2842 (VGAM2842) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39717] VGAM2842 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2842 was detected is described hereinabove with reference to Figs. 2-8.

[39718] VGAM2842 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D.

VGAM2842 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39719] VGAM2842 gene, herein designated VGAM GENE, encodes a VGAM2842 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2842 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2842 precursor RNA is designated SEQ ID:2530, and is provided hereinbelow with reference to the sequence listing part.

[39720] VGAM2842 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39721] An enzyme complex designated DICER COMPLEX, dices

the VGAM2842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2842 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2842 RNA is designated SEQ ID:5600, and is provided hereinbelow with reference to the sequence listing part.

[39722] VGAM2842 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2842 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2842 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39723] VGAM2842 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2842 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2842 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2842 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2842 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39724] The complementary binding of VGAM2842 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2842 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2842 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2842 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39725] It is appreciated that VGAM2842 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2842 host target genes. The mRNA of each one of this plurality of VGAM2842 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2842 RNA, herein designated VGAM RNA, and which when bound by VGAM2842 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2842 host target proteins.

[39726] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2842 gene, herein designated VGAM GENE, on one or more VGAM2842 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39727] It is yet further appreciated that a function of VGAM2842 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2842 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM2842 correlate with, and may be deduced from, the identity of the host target genes which VGAM2842 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39728] Nucleotide sequences of the VGAM2842 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2842 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2842 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2842 are further described hereinbelow with reference to Table 1.

[39729] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2842 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39730] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2843 (VGAM2843) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39731] VGAM2843 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2843 was detected is described hereinabove with reference to Figs. 2-8.

[39732] VGAM2843 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM2843 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[39733] VGAM2843 gene, herein designated VGAM GENE, encodes a VGAM2843 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2843 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2843 precursor RNA is designated SEQ ID:2526, and is provided hereinbelow with reference to the sequence listing part.

[39734] VGAM2843 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2843 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39735] An enzyme complex designated DICER COMPLEX, dices the VGAM2843 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2843 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2843 RNA is designated SEQ ID:5596, and is provided hereinbelow with reference to the sequence listing part.

[39736] VGAM2843 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2843 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2843 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39737] VGAM2843 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2843 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2843 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2843 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2843 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39738] The complementary binding of VGAM2843 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2843 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2843

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2843 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39739] It is appreciated that VGAM2843 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2843 host target genes. The mRNA of each one of this plurality of VGAM2843 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2843 RNA, herein designated VGAM RNA, and which when bound by VGAM2843 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2843 host target proteins.

[39740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2843 gene, herein designated VGAM GENE, on one or more VGAM2843 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39741] It is yet further appreciated that a function of VGAM2843 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2843 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM2843 correlate with, and may be deduced from, the identity of the host target genes which VGAM2843 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39742] Nucleotide sequences of the VGAM2843 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2843 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2843 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2843 are further described hereinbelow with reference to Table 1.

[39743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2843 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39744] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2844 (VGAM2844) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39745] VGAM2844 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2844 was detected is described hereinabove with reference to Figs. 2-8.

[39746] VGAM2844 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM2844 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[39747] VGAM2844 gene, herein designated VGAM GENE, encodes a VGAM2844 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2844 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2844 precursor RNA is designated SEQ ID:2527, and is provided hereinbelow with reference to the sequence listing part.

[39748] VGAM2844 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39749] An enzyme complex designated DICER COMPLEX, dices the VGAM2844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2844 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2844 RNA is designated SEQ ID:5597, and is provided hereinbelow with reference to the sequence listing part.

[39750] VGAM2844 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2844 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2844 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39751] VGAM2844 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2844 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2844 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2844 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2844 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39752] The complementary binding of VGAM2844 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2844 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2844 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2844 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39753] It is appreciated that VGAM2844 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2844 host target genes. The mRNA of each one of this plurality of VGAM2844 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2844 RNA, herein designated VGAM RNA, and which when bound by VGAM2844 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2844 host target proteins.

[39754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2844 gene, herein designated VGAM GENE, on one or more VGAM2844 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39755] It is yet further appreciated that a function of VGAM2844 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2844 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2844 correlate with, and may be deduced from, the identity of the host target genes which VGAM2844 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39756] Nucleotide sequences of the VGAM2844 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2844 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2844 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2844 are further

described hereinbelow with reference to Table 1.

[39757] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2844 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39758] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2845 (VGAM2845) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39759] VGAM2845 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2845 was detected is described hereinabove with reference to Figs. 2-8.

[39760] VGAM2845 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Black queen cell virus. VGAM2845 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39761] VGAM2845 gene, herein designated VGAM GENE, encodes a VGAM2845 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2845 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2845 precursor RNA is designated SEQ ID:2531, and is provided hereinbelow with reference to the sequence listing part.

[39762] VGAM2845 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[39763] An enzyme complex designated DICER COMPLEX, dices the VGAM2845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2845 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2845 RNA is designated SEQ ID:5601, and is provided hereinbelow with reference to the sequence listing part.

[39764] VGAM2845 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39765] VGAM2845 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2845 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2845 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39766] The complementary binding of VGAM2845 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2845 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2845 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39767] It is appreciated that VGAM2845 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2845 host target genes. The mRNA of each one of this plurality of VGAM2845 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2845 RNA, herein designated VGAM RNA, and which when bound by VGAM2845 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2845 host target proteins.

[39768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2845 gene, herein designated VGAM GENE, on one or more VGAM2845 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39769] It is yet further appreciated that a function of VGAM2845 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2845 include diagnosis, prevention and treatment of viral infection by Black queen cell virus. Specific functions, and accordingly utilities, of VGAM2845 correlate with, and may be deduced from, the identity of the host target genes which VGAM2845 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39770] Nucleotide sequences of the VGAM2845 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2845 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2845 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2845 are further described hereinbelow with reference to Table 1.

[39771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2845 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39772] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2846 (VGAM2846) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39773] VGAM2846 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2846 was detected is described hereinabove with reference to Figs. 2-8.

[39774] VGAM2846 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Molluscum contagiosum virus. VGAM2846 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39775] VGAM2846 gene, herein designated VGAM GENE, encodes a VGAM2846 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2846 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2846 precursor RNA is designated SEQ ID:2532, and is provided hereinbelow with reference to the sequence listing part.

[39776] VGAM2846 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39777] An enzyme complex designated DICER COMPLEX, dices the VGAM2846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2846 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2846 RNA is designated SEQ ID:5602, and is provided hereinbelow with reference to the sequence listing part.

[39778] VGAM2846 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2846 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2846 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39779] VGAM2846 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2846 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2846 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2846 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2846 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39780] The complementary binding of VGAM2846 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2846 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2846 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2846 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39781] It is appreciated that VGAM2846 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2846 host target genes. The mRNA of each one of this plurality of VGAM2846 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2846 RNA, herein designated VGAM RNA, and which when bound by VGAM2846 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2846 host target proteins.

[39782] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2846 gene, herein designated VGAM GENE, on one or more VGAM2846 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39783] It is yet further appreciated that a function of VGAM2846 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2846 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2846 correlate with, and may be deduced from, the identity of the host target genes which VGAM2846 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39784] Nucleotide sequences of the VGAM2846 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2846 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2846 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2846 are further described hereinbelow with reference to Table 1.

[39785] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2846 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39786] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2847 (VGAM2847) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39787] VGAM2847 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2847 was detected is described hereinabove with reference to Figs. 2-8.

[39788] VGAM2847 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yam mosaic virus.

VGAM2847 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39789] VGAM2847 gene, herein designated VGAM GENE, encodes a VGAM2847 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2847 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2847 precursor RNA is designated SEQ ID:2533, and is provided hereinbelow with reference to the sequence listing part.

[39790] VGAM2847 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39791] An enzyme complex designated DICER COMPLEX, dices

the VGAM2847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2847 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2847 RNA is designated SEQ ID:5603, and is provided hereinbelow with reference to the sequence listing part.

[39792] VGAM2847 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2847 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2847 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39793] VGAM2847 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2847 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2847 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2847 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2847 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39794] The complementary binding of VGAM2847 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2847 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2847 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2847 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39795] It is appreciated that VGAM2847 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2847 host target genes. The mRNA of each one of this plurality of VGAM2847 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2847 RNA, herein designated VGAM RNA, and which when bound by VGAM2847 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2847 host target proteins.

[39796] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2847 gene, herein designated VGAM GENE, on one or more VGAM2847 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39797] It is yet further appreciated that a function of VGAM2847 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2847 include diagnosis, prevention and treatment of viral infection by Yam mosaic virus. Specific functions, and accordingly utilities, of VGAM2847 correlate with, and may be deduced from, the identity of the host target genes which VGAM2847 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39798] Nucleotide sequences of the VGAM2847 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2847 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2847 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2847 are further described hereinbelow with reference to Table 1.

[39799] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2847 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39800] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2848 (VGAM2848) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39801] VGAM2848 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2848 was detected is described hereinabove with reference to Figs. 2-8.

[39802] VGAM2848 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yam mosaic virus. VGAM2848 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[39803] VGAM2848 gene, herein designated VGAM GENE, encodes a VGAM2848 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2848 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2848 precursor RNA is designated SEQ ID:2534, and is provided hereinbelow with reference to the sequence listing part.

[39804] VGAM2848 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2848 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39805] An enzyme complex designated DICER COMPLEX, dices the VGAM2848 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2848 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2848 RNA is designated SEQ ID:5604, and is provided hereinbelow with reference to the sequence listing part.

[39806] VGAM2848 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2848 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2848 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39807] VGAM2848 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2848 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2848 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2848 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2848 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39808] The complementary binding of VGAM2848 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2848 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2848

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2848 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39809] It is appreciated that VGAM2848 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2848 host target genes. The mRNA of each one of this plurality of VGAM2848 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2848 RNA, herein designated VGAM RNA, and which when bound by VGAM2848 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2848 host target proteins.

[39810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2848 gene, herein designated VGAM GENE, on one or more VGAM2848 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39811] It is yet further appreciated that a function of VGAM2848 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2848 include diagnosis, prevention and treatment of viral infection by Yam mosaic virus. Specific functions, and accordingly utilities, of VGAM2848 correlate with, and may be deduced from, the identity of the host target genes which VGAM2848 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39812] Nucleotide sequences of the VGAM2848 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2848 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2848 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2848 are further described hereinbelow with reference to Table 1.

[39813] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2848 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39814] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2849 (VGAM2849) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39815] VGAM2849 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2849 was detected is described hereinabove with reference to Figs. 2-8.

[39816] VGAM2849 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chinese wheat mosaic virus. VGAM2849 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[39817] VGAM2849 gene, herein designated VGAM GENE, encodes a VGAM2849 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2849 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2849 precursor RNA is designated SEQ ID:2537, and is provided hereinbelow with reference to the sequence listing part.

[39818] VGAM2849 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39819] An enzyme complex designated DICER COMPLEX, dices the VGAM2849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2849 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2849 RNA is designated SEQ ID:5607, and is provided hereinbelow with reference to the sequence listing part.

[39820] VGAM2849 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2849 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2849 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39821] VGAM2849 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2849 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2849 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2849 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2849 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39822] The complementary binding of VGAM2849 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2849 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2849 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2849 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39823] It is appreciated that VGAM2849 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2849 host target genes. The mRNA of each one of this plurality of VGAM2849 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2849 RNA, herein designated VGAM RNA, and which when bound by VGAM2849 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2849 host target proteins.

[39824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2849 gene, herein designated VGAM GENE, on one or more VGAM2849 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39825] It is yet further appreciated that a function of VGAM2849 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2849 include diagnosis, prevention and treatment of viral infection by Chinese wheat mosaic virus. Specific functions, and accordingly utilities, of VGAM2849 correlate with, and may be deduced from, the identity of the host target genes which VGAM2849 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39826] Nucleotide sequences of the VGAM2849 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2849 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2849 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2849 are further

described hereinbelow with reference to Table 1.

[39827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2849 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39828] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2850 (VGAM2850) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39829] VGAM2850 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2850 was detected is described hereinabove with reference to Figs. 2-8.

[39830] VGAM2850 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura syndrome virus. VGAM2850 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39831] VGAM2850 gene, herein designated VGAM GENE, encodes a VGAM2850 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2850 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2850 precursor RNA is designated SEQ ID:2538, and is provided hereinbelow with reference to the sequence listing part.

[39832] VGAM2850 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39833] An enzyme complex designated DICER COMPLEX, dices the VGAM2850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2850 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2850 RNA is designated SEQ ID:5608, and is provided hereinbelow with reference to the sequence listing part.

[39834] VGAM2850 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39835] VGAM2850 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2850 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2850 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39836] The complementary binding of VGAM2850 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2850 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2850 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39837] It is appreciated that VGAM2850 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2850 host target genes. The mRNA of each one of this plurality of VGAM2850 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2850 RNA, herein designated VGAM RNA, and which when bound by VGAM2850 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2850 host target proteins.

[39838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2850 gene, herein designated VGAM GENE, on one or more VGAM2850 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39839] It is yet further appreciated that a function of VGAM2850 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2850 include diagnosis, prevention and treatment of viral infection by Taura syndrome virus. Specific functions, and accordingly utilities, of VGAM2850 correlate with, and may be deduced from, the identity of the host target genes which VGAM2850 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39840] Nucleotide sequences of the VGAM2850 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2850 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2850 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2850 are further described hereinbelow with reference to Table 1.

[39841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2850 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39842] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2851 (VGAM2851) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39843] VGAM2851 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2851 was detected is described hereinabove with reference to Figs. 2-8.

[39844] VGAM2851 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Papaya ringspot virus. VGAM2851 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39845] VGAM2851 gene, herein designated VGAM GENE, encodes

a VGAM2851 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2851 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2851 precursor RNA is designated SEQ ID:2539, and is provided hereinbelow with reference to the sequence listing part.

[39846] VGAM2851 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39847] An enzyme complex designated DICER COMPLEX, dices the VGAM2851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2851 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2851 RNA is designated SEQ ID:5609, and is provided hereinbelow with reference to the sequence listing part.

[39848] VGAM2851 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39849] VGAM2851 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2851 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2851 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39850] The complementary binding of VGAM2851 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2851 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2851 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[39851] It is appreciated that VGAM2851 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2851 host target genes. The mRNA of each one of this plurality of VGAM2851 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2851 RNA, herein designated VGAM RNA, and which when bound by VGAM2851 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2851 host target proteins.

[39852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2851 gene, herein designated VGAM GENE, on one or more VGAM2851 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39853] It is yet further appreciated that a function of VGAM2851 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2851 include diagnosis, prevention and treatment of viral infection by Papaya ringspot virus. Specific functions, and accordingly utilities, of VGAM2851 correlate with, and may be deduced from, the identity of the host target genes which VGAM2851 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39854] Nucleotide sequences of the VGAM2851 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2851 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2851 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2851 are further described hereinbelow with reference to Table 1.

[39855] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2851 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39856] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2852 (VGAM2852) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39857] VGAM2852 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2852 was detected is described hereinabove with reference to Figs. 2-8.

[39858] VGAM2852 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle disease virus. VGAM2852 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39859] VGAM2852 gene, herein designated VGAM GENE, encodes a VGAM2852 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2852 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2852 precursor RNA is designated SEQ ID:2540, and is provided hereinbelow with reference to the sequence listing part.

[39860] VGAM2852 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39861] An enzyme complex designated DICER COMPLEX, dices the VGAM2852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2852 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2852 RNA is designated SEQ ID:5610, and is provided hereinbelow with reference to the sequence listing part.

[39862] VGAM2852 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39863] VGAM2852 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2852 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2852 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39864] The complementary binding of VGAM2852 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2852 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2852 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39865] It is appreciated that VGAM2852 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2852 host target genes. The mRNA of each one of this plurality of VGAM2852 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2852 RNA, herein designated VGAM RNA, and which when bound by VGAM2852 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2852 host target proteins.

[39866] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2852 gene, herein designated VGAM GENE, on one or more VGAM2852 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39867] It is yet further appreciated that a function of VGAM2852 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2852 include diagnosis, prevention and treatment of viral infection by Newcastle disease virus. Specific functions, and accordingly utilities, of VGAM2852 correlate with, and may be deduced from, the identity of the host target genes which VGAM2852 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39868] Nucleotide sequences of the VGAM2852 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2852 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2852 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2852 are further described hereinbelow with reference to Table 1.

[39869] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2852 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39870] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2853 (VGAM2853) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39871] VGAM2853 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2853 was detected is described hereinabove with reference to Figs. 2-8.

[39872] VGAM2853 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2853 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39873] VGAM2853 gene, herein designated VGAM GENE, encodes a VGAM2853 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2853 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2853 precursor RNA is designated SEQ ID:2541, and is provided hereinbelow with reference to the sequence listing part.

[39874] VGAM2853 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39875] An enzyme complex designated DICER COMPLEX, dices the VGAM2853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2853 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2853 RNA is designated SEQ ID:5611, and is provided hereinbelow with reference to the sequence listing part.

[39876] VGAM2853 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39877] VGAM2853 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2853 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2853 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39878] The complementary binding of VGAM2853 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2853 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2853 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39879] It is appreciated that VGAM2853 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2853 host target genes. The mRNA of each one of this plurality of VGAM2853 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2853 RNA, herein designated VGAM RNA, and which when bound by VGAM2853 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2853 host target proteins.

[39880] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2853 gene, herein designated VGAM GENE, on one or more VGAM2853 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39881] It is yet further appreciated that a function of VGAM2853 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2853 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2853 correlate with, and may be deduced from, the identity of the host target genes which VGAM2853 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39882] Nucleotide sequences of the VGAM2853 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2853 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2853 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2853 are further described hereinbelow with reference to Table 1.

[39883] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2853 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39884] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2854 (VGAM2854) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39885] VGAM2854 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2854 was detected is described hereinabove with reference to Figs. 2-8.

[39886] VGAM2854 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2854 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39887] VGAM2854 gene, herein designated VGAM GENE, encodes a VGAM2854 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2854 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2854 precursor RNA is designated SEQ ID:2542, and is provided hereinbelow with reference to the sequence listing part.

[39888] VGAM2854 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39889] An enzyme complex designated DICER COMPLEX, dices the VGAM2854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2854 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2854 RNA is designated SEQ ID:5612, and is provided hereinbelow with reference to the sequence listing part.

[39890] VGAM2854 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39891] VGAM2854 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2854 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2854 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39892] The complementary binding of VGAM2854 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2854 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2854 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39893] It is appreciated that VGAM2854 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2854 host target genes. The mRNA of each one of this plurality of VGAM2854 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2854 RNA, herein designated VGAM RNA, and which when bound by VGAM2854 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2854 host target proteins.

[39894] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2854 gene, herein designated VGAM GENE, on one or more VGAM2854 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39895] It is yet further appreciated that a function of VGAM2854 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2854 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2854 correlate with, and may be deduced from, the identity of the host target genes which VGAM2854 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39896] Nucleotide sequences of the VGAM2854 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2854 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2854 are further described hereinbelow with reference to Table 1.

[39897] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2854 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39898] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2855 (VGAM2855) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39899] VGAM2855 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2855 was detected is described hereinabove with reference to Figs. 2-8.

[39900] VGAM2855 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2855 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39901] VGAM2855 gene, herein designated VGAM GENE, encodes a VGAM2855 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2855 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2855 precursor RNA is designated SEQ ID:2545, and is provided hereinbelow with reference to the sequence listing part.

[39902] VGAM2855 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39903] An enzyme complex designated DICER COMPLEX, dices the VGAM2855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2855 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide se-

quence of VGAM2855 RNA is designated SEQ ID:5615, and is provided hereinbelow with reference to the sequence listing part.

[39904] VGAM2855 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39905] VGAM2855 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2855 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2855 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39906] The complementary binding of VGAM2855 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2855 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2855 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39907] It is appreciated that VGAM2855 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2855 host target genes. The mRNA of

each one of this plurality of VGAM2855 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2855 RNA, herein designated VGAM RNA, and which when bound by VGAM2855 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2855 host target proteins.

[39908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2855 gene, herein designated VGAM GENE, on one or more VGAM2855 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[39909] It is yet further appreciated that a function of VGAM2855 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2855 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2855 correlate with, and may be deduced from, the identity of the host target genes which VGAM2855 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39910] Nucleotide sequences of the VGAM2855 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2855 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2855 are further described hereinbelow with reference to Table 1.

[39911] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2855 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[39912] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2856 (VGAM2856) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39913] VGAM2856 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2856 was detected is described hereinabove with reference to Figs. 2-8.

[39914] VGAM2856 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2856 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39915] VGAM2856 gene, herein designated VGAM GENE, encodes a VGAM2856 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2856 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2856 precursor RNA is designated SEQ ID:2543, and is provided hereinbelow with reference to the sequence listing part.

[39916] VGAM2856 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39917] An enzyme complex designated DICER COMPLEX, dices the VGAM2856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2856 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2856 RNA is designated SEQ ID:5613, and

is provided hereinbelow with reference to the sequence listing part.

[39918] VGAM2856 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39919] VGAM2856 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2856 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2856 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39920] The complementary binding of VGAM2856 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2856 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2856 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39921] It is appreciated that VGAM2856 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2856 host target genes. The mRNA of each one of this plurality of VGAM2856 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2856 RNA, herein designated VGAM RNA, and which when bound by VGAM2856 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2856 host target proteins.

[39922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2856 gene, herein designated VGAM GENE, on one or more VGAM2856 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39923] It is yet further appreciated that a function of VGAM2856 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2856 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2856 correlate with, and may be deduced from, the identity of the host target genes which VGAM2856 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39924] Nucleotide sequences of the VGAM2856 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2856 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2856 are further described hereinbelow with reference to Table 1.

[39925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2856 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39926] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2857 (VGAM2857) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39927] VGAM2857 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2857 was detected is described hereinabove with reference to Figs. 2-8.

[39928] VGAM2857 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM2857 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39929] VGAM2857 gene, herein designated VGAM GENE, encodes a VGAM2857 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2857 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2857 precur-

sor RNA is designated SEQ ID:2544, and is provided hereinbelow with reference to the sequence listing part.

[39930] VGAM2857 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39931] An enzyme complex designated DICER COMPLEX, dices the VGAM2857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2857 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2857 RNA is designated SEQ ID:5614, and is provided hereinbelow with reference to the sequence

listing part.

[39932] VGAM2857 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39933] VGAM2857 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2857 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2857 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39934] The complementary binding of VGAM2857 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2857 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2857 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39935] It is appreciated that VGAM2857 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2857 host target genes. The mRNA of each one of this plurality of VGAM2857 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2857 RNA, herein designated VGAM RNA, and which when bound by VGAM2857 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2857 host target proteins.

[39936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2857 gene, herein designated VGAM GENE, on one or more VGAM2857 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39937] It is yet further appreciated that a function of VGAM2857

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2857 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2857 correlate with, and may be deduced from, the identity of the host target genes which VGAM2857 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39938] Nucleotide sequences of the VGAM2857 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2857 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2857 are further described hereinbelow with reference to Table 1.

[39939] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2857 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39940] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2858 (VGAM2858) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39941] VGAM2858 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2858 was detected is described hereinabove with reference to Figs. 2-8.

[39942] VGAM2858 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco necrosis virus D. VGAM2858 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39943] VGAM2858 gene, herein designated VGAM GENE, encodes a VGAM2858 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2858 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2858 precursor RNA is designated SEQ ID:2550, and is provided here-

inbelow with reference to the sequence listing part.

[39944] VGAM2858 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39945] An enzyme complex designated DICER COMPLEX, dices the VGAM2858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2858 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2858 RNA is designated SEQ ID:5620, and is provided hereinbelow with reference to the sequence listing part.

[39946] VGAM2858 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39947] VGAM2858 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2858 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2858 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39948] The complementary binding of VGAM2858 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2858 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2858 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39949] It is appreciated that VGAM2858 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2858 host target genes. The mRNA of each one of this plurality of VGAM2858 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2858 RNA, herein designated VGAM RNA, and which when bound by VGAM2858 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2858 host target proteins.

[39950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2858 gene, herein designated VGAM GENE, on one or more VGAM2858 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39951] It is yet further appreciated that a function of VGAM2858 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2858 include diagnosis, prevention and treatment of viral infection by Tobacco necrosis virus D. Specific functions, and accordingly utilities, of VGAM2858 correlate with, and may be deduced from, the identity of the host target genes which VGAM2858 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39952] Nucleotide sequences of the VGAM2858 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2858 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2858 are further described hereinbelow with reference to Table 1.

[39953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2858 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39954] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2859 (VGAM2859) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39955] VGAM2859 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2859 was detected is described hereinabove with reference to Figs. 2-8.

[39956] VGAM2859 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2859 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39957] VGAM2859 gene, herein designated VGAM GENE, encodes a VGAM2859 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2859 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2859 precursor RNA is designated SEQ ID:2551, and is provided hereinbelow with reference to the sequence listing part.

[39958] VGAM2859 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39959] An enzyme complex designated DICER COMPLEX, dices the VGAM2859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2859 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2859 RNA is designated SEQ ID:5621, and is provided hereinbelow with reference to the sequence listing part.

[39960] VGAM2859 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39961] VGAM2859 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2859 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2859 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39962] The complementary binding of VGAM2859 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2859 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2859 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39963] It is appreciated that VGAM2859 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2859 host target genes. The mRNA of each one of this plurality of VGAM2859 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2859 RNA, herein designated VGAM

RNA, and which when bound by VGAM2859 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2859 host target proteins.

[39964] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2859 gene, herein designated VGAM GENE, on one or more VGAM2859 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39965] It is yet further appreciated that a function of VGAM2859 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2859 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2859 correlate with, and may be deduced from, the identity of the host target genes which VGAM2859 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39966] Nucleotide sequences of the VGAM2859 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2859 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2859 are further described hereinbelow with reference to Table 1.

[39967] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2859 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39968] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2860 (VGAM2860) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39969] VGAM2860 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2860 was detected is described hereinabove with reference to Figs. 2-8.

[39970] VGAM2860 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea enation mosaic virus-2. VGAM2860 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39971] VGAM2860 gene, herein designated VGAM GENE, encodes a VGAM2860 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2860 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2860 precursor RNA is designated SEQ ID:1933, and is provided hereinbelow with reference to the sequence listing part.

[39972] VGAM2860 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39973] An enzyme complex designated DICER COMPLEX, dices the VGAM2860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2860 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2860 RNA is designated SEQ ID:5003, and is provided hereinbelow with reference to the sequence listing part.

[39974] VGAM2860 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2860 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2860 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39975] VGAM2860 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2860 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2860 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2860 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2860 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39976] The complementary binding of VGAM2860 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2860 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2860 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2860 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39977] It is appreciated that VGAM2860 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2860 host target genes. The mRNA of each one of this plurality of VGAM2860 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2860 RNA, herein designated VGAM RNA, and which when bound by VGAM2860 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2860 host target proteins.

[39978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2860 gene, herein designated VGAM GENE, on one or more VGAM2860 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39979] It is yet further appreciated that a function of VGAM2860 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2860 include diagnosis, prevention and

treatment of viral infection by Pea enation mosaic virus-2. Specific functions, and accordingly utilities, of VGAM2860 correlate with, and may be deduced from, the identity of the host target genes which VGAM2860 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39980] Nucleotide sequences of the VGAM2860 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2860 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2860 are further described hereinbelow with reference to Table 1.

[39981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2860 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39982] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2861 (VGAM2861) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[39983] VGAM2861 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2861 was detected is described hereinabove with reference to Figs. 2-8.

[39984] VGAM2861 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Periplaneta fuliginosa densovirus. VGAM2861 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39985] VGAM2861 gene, herein designated VGAM GENE, encodes a VGAM2861 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2861 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2861 precursor RNA is designated SEQ ID:2546, and is provided hereinbelow with reference to the sequence listing part.

[39986] VGAM2861 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2861 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[39987] An enzyme complex designated DICER COMPLEX, dices the VGAM2861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2861 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2861 RNA is designated SEQ ID:5616, and is provided hereinbelow with reference to the sequence listing part.

[39988] VGAM2861 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2861 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2861 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[39989] VGAM2861 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2861 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2861 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2861 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2861 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[39990] The complementary binding of VGAM2861 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2861 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2861 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2861 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[39991] It is appreciated that VGAM2861 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2861 host target genes. The mRNA of each one of this plurality of VGAM2861 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2861 RNA, herein designated VGAM RNA, and which when bound by VGAM2861 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2861 host target proteins.

[39992] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2861 gene, herein designated VGAM GENE, on one or more VGAM2861 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[39993] It is yet further appreciated that a function of VGAM2861 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2861 include diagnosis, prevention and treatment of viral infection by Periplaneta fuliginosa

densovirus. Specific functions, and accordingly utilities, of VGAM2861 correlate with, and may be deduced from, the identity of the host target genes which VGAM2861 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[39994] Nucleotide sequences of the VGAM2861 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2861 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2861 are further described hereinbelow with reference to Table 1.

[39995] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2861 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[39996] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2862 (VGAM2862) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[39997] VGAM2862 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2862 was detected is described hereinabove with reference to Figs. 2-8.

[39998] VGAM2862 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2862 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[39999] VGAM2862 gene, herein designated VGAM GENE, encodes a VGAM2862 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2862 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2862 precursor RNA is designated SEQ ID:2547, and is provided hereinbelow with reference to the sequence listing part.

[40000] VGAM2862 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2862 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40001] An enzyme complex designated DICER COMPLEX, dices the VGAM2862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2862 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2862 RNA is designated SEQ ID:5617, and is provided hereinbelow with reference to the sequence listing part.

[40002] VGAM2862 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2862 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2862 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40003] VGAM2862 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2862 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2862 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2862 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2862 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40004] The complementary binding of VGAM2862 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2862 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2862 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2862 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40005] It is appreciated that VGAM2862 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2862 host target genes. The mRNA of each one of this plurality of VGAM2862 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2862 RNA, herein designated VGAM RNA, and which when bound by VGAM2862 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2862 host target proteins.

[40006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2862 gene, herein designated VGAM GENE, on one or more VGAM2862 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40007] It is yet further appreciated that a function of VGAM2862 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2862 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2862

correlate with, and may be deduced from, the identity of the host target genes which VGAM2862 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40008] Nucleotide sequences of the VGAM2862 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2862 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2862 are further described hereinbelow with reference to Table 1.

[40009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2862 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40010] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2863 (VGAM2863) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[40011] VGAM2863 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2863 was detected is described hereinabove with reference to Figs. 2-8.

[40012] VGAM2863 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2863 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40013] VGAM2863 gene, herein designated VGAM GENE, encodes a VGAM2863 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2863 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2863 precursor RNA is designated SEQ ID:2552, and is provided hereinbelow with reference to the sequence listing part.

[40014] VGAM2863 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40015] An enzyme complex designated DICER COMPLEX, dices the VGAM2863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2863 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2863 RNA is designated SEQ ID:5622, and is provided hereinbelow with reference to the sequence listing part.

[40016] VGAM2863 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40017] VGAM2863 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2863 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2863 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40018] The complementary binding of VGAM2863 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2863 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2863 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40019] It is appreciated that VGAM2863 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2863 host target genes. The mRNA of each one of this plurality of VGAM2863 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2863 RNA, herein designated VGAM RNA, and which when bound by VGAM2863 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2863 host target proteins.

[40020] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2863 gene, herein designated VGAM GENE, on one or more VGAM2863 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40021] It is yet further appreciated that a function of VGAM2863 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2863 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2863 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2863 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40022] Nucleotide sequences of the VGAM2863 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2863 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2863 are further described hereinbelow with reference to Table 1.

[40023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2863 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40024] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2864 (VGAM2864) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40025] VGAM2864 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2864 was detected is described hereinabove with reference to Figs. 2-8.

[40026] VGAM2864 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM2864 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40027] VGAM2864 gene, herein designated VGAM GENE, encodes a VGAM2864 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2864 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2864 precursor RNA is designated SEQ ID:1934, and is provided hereinbelow with reference to the sequence listing part.

[40028] VGAM2864 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40029] An enzyme complex designated DICER COMPLEX, dices the VGAM2864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2864 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2864 RNA is designated SEQ ID:5004, and is provided hereinbelow with reference to the sequence listing part.

[40030] VGAM2864 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40031] VGAM2864 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2864 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2864 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40032] The complementary binding of VGAM2864 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2864 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2864 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40033] It is appreciated that VGAM2864 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2864 host target genes. The mRNA of each one of this plurality of VGAM2864 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2864 RNA, herein designated VGAM RNA, and which when bound by VGAM2864 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2864 host target proteins.

[40034] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2864 gene, herein designated VGAM GENE, on one or more VGAM2864 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40035] It is yet further appreciated that a function of VGAM2864 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2864 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2864 correlate with, and may be deduced from, the identity of the host target genes which VGAM2864 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[40036] Nucleotide sequences of the VGAM2864 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2864 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2864 are further described hereinbelow with reference to Table 1.

[40037] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2864 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40038] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2865 (VGAM2865) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40039] VGAM2865 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2865 was detected is described hereinabove with reference to Figs. 2-8.

[40040] VGAM2865 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2865 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40041] VGAM2865 gene, herein designated VGAM GENE, encodes a VGAM2865 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2865 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2865 precursor RNA is designated SEQ ID:1935, and is provided hereinbelow with reference to the sequence listing part.

[40042] VGAM2865 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40043] An enzyme complex designated DICER COMPLEX, dices the VGAM2865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2865 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2865 RNA is designated SEQ ID:5005, and is provided hereinbelow with reference to the sequence listing part.

[40044] VGAM2865 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40045] VGAM2865 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2865 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2865 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[40046] The complementary binding of VGAM2865 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2865 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2865 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40047] It is appreciated that VGAM2865 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2865 host target genes. The mRNA of each one of this plurality of VGAM2865 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2865 RNA, herein designated VGAM RNA, and which when bound by VGAM2865 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2865 host target proteins.

[40048] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2865 gene, herein designated VGAM GENE, on one or more VGAM2865 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40049] It is yet further appreciated that a function of VGAM2865 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2865 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2865 correlate with, and may be deduced from, the identity of the host target genes which VGAM2865 binds and inhibits, and the function of these

host target genes, as elaborated hereinbelow.

[40050] Nucleotide sequences of the VGAM2865 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2865 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2865 are further described hereinbelow with reference to Table 1.

[40051] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2865 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40052] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2866 (VGAM2866) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40053] VGAM2866 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2866 was detected is described hereinabove with reference to Figs. 2-8.

[40054] VGAM2866 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2866 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40055] VGAM2866 gene, herein designated VGAM GENE, encodes a VGAM2866 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2866 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2866 precursor RNA is designated SEQ ID:2548, and is provided hereinbelow with reference to the sequence listing part.

[40056] VGAM2866 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40057] An enzyme complex designated DICER COMPLEX, dices the VGAM2866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2866 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2866 RNA is designated SEQ ID:5618, and is provided hereinbelow with reference to the sequence listing part.

[40058] VGAM2866 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[40059] VGAM2866 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2866 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2866 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40060] The complementary binding of VGAM2866 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2866 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2866 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40061] It is appreciated that VGAM2866 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2866 host target genes. The mRNA of each one of this plurality of VGAM2866 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2866 RNA, herein designated VGAM RNA, and which when bound by VGAM2866 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2866 host target proteins.

[40062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2866 gene, herein designated VGAM GENE, on one

or more VGAM2866 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40063] It is yet further appreciated that a function of VGAM2866 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2866 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2866 correlate with, and may be deduced from, the identity of the host target genes which VGAM2866 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40064] Nucleotide sequences of the VGAM2866 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2866 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2866 are further described hereinbelow with reference to Table 1.

[40065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2866 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40066] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2867 (VGAM2867) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40067] VGAM2867 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2867 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[40068] VGAM2867 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2867 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40069] VGAM2867 gene, herein designated VGAM GENE, encodes a VGAM2867 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2867 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2867 precursor RNA is designated SEQ ID:2553, and is provided hereinbelow with reference to the sequence listing part.

[40070] VGAM2867 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40071] An enzyme complex designated DICER COMPLEX, dices the VGAM2867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2867 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2867 RNA is designated SEQ ID:5623, and is provided hereinbelow with reference to the sequence listing part.

[40072] VGAM2867 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40073] VGAM2867 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2867 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2867 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40074] The complementary binding of VGAM2867 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2867 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2867 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40075] It is appreciated that VGAM2867 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2867 host target genes. The mRNA of each one of this plurality of VGAM2867 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2867 RNA, herein designated VGAM RNA, and which when bound by VGAM2867 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2867 host target proteins.

[40076] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2867 gene, herein designated VGAM GENE, on one or more VGAM2867 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40077] It is yet further appreciated that a function of VGAM2867 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2867 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2867 correlate with, and may be deduced from, the identity of the host target genes which VGAM2867 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40078] Nucleotide sequences of the VGAM2867 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2867 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2867 are further described hereinbelow with reference to Table 1.

[40079] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2867 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40080] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2868 (VGAM2868) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40081] VGAM2868 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2868 was detected is described hereinabove with reference to Figs. 2-8.

[40082] VGAM2868 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2868 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40083] VGAM2868 gene, herein designated VGAM GENE, encodes a VGAM2868 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2868 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2868 precursor RNA is designated SEQ ID:2549, and is provided hereinbelow with reference to the sequence listing part.

[40084] VGAM2868 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[40085] An enzyme complex designated DICER COMPLEX, dices the VGAM2868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2868 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2868 RNA is designated SEQ ID:5619, and is provided hereinbelow with reference to the sequence listing part.

[40086] VGAM2868 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40087] VGAM2868 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2868 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2868 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40088] The complementary binding of VGAM2868 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2868 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2868 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40089] It is appreciated that VGAM2868 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2868 host target genes. The mRNA of each one of this plurality of VGAM2868 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2868 RNA, herein designated VGAM RNA, and which when bound by VGAM2868 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2868 host target proteins.

[40090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2868 gene, herein designated VGAM GENE, on one or more VGAM2868 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40091] It is yet further appreciated that a function of VGAM2868 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2868 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2868 correlate with, and may be deduced from, the identity of the host target genes which VGAM2868 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40092] Nucleotide sequences of the VGAM2868 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2868 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2868 are further described hereinbelow with reference to Table 1.

[40093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2868 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40094] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2869 (VGAM2869) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40095] VGAM2869 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2869 was detected is described hereinabove with reference to Figs. 2-8.

[40096] VGAM2869 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human papillomavirus type 19. VGAM2869 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40097] VGAM2869 gene, herein designated VGAM GENE, encodes a VGAM2869 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2869 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2869 precursor RNA is designated SEQ ID:1936, and is provided hereinbelow with reference to the sequence listing part.

[40098] VGAM2869 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40099] An enzyme complex designated DICER COMPLEX, dices the VGAM2869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2869 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2869 RNA is designated SEQ ID:5006, and is provided hereinbelow with reference to the sequence listing part.

[40100] VGAM2869 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2869 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2869 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40101] VGAM2869 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2869 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2869 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2869 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2869 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40102] The complementary binding of VGAM2869 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2869 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2869 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2869 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40103] It is appreciated that VGAM2869 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2869 host target genes. The mRNA of each one of this plurality of VGAM2869 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2869 RNA, herein designated VGAM RNA, and which when bound by VGAM2869 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2869 host target proteins.

[40104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2869 gene, herein designated VGAM GENE, on one or more VGAM2869 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40105] It is yet further appreciated that a function of VGAM2869 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2869 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 19. Specific functions, and accordingly utilities, of VGAM2869 correlate with, and may be deduced from, the identity of the host target genes which VGAM2869 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40106] Nucleotide sequences of the VGAM2869 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2869 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2869 are further described hereinbelow with reference to Table 1.

[40107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2869 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40108] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2870 (VGAM2870) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40109] VGAM2870 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2870 was detected is described hereinabove with reference to Figs. 2-8.

[40110] VGAM2870 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus

type 25. VGAM2870 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40111] VGAM2870 gene, herein designated VGAM GENE, encodes a VGAM2870 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2870 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2870 precursor RNA is designated SEQ ID:1941, and is provided hereinbelow with reference to the sequence listing part.

[40112] VGAM2870 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40113] An enzyme complex designated DICER COMPLEX, dices

the VGAM2870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2870 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2870 RNA is designated SEQ ID:5011, and is provided hereinbelow with reference to the sequence listing part.

[40114] VGAM2870 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2870 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2870 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40115] VGAM2870 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2870 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2870 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2870 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2870 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40116] The complementary binding of VGAM2870 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2870 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2870 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2870 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40117] It is appreciated that VGAM2870 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2870 host target genes. The mRNA of each one of this plurality of VGAM2870 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2870 RNA, herein designated VGAM RNA, and which when bound by VGAM2870 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2870 host target proteins.

[40118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2870 gene, herein designated VGAM GENE, on one or more VGAM2870 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40119] It is yet further appreciated that a function of VGAM2870 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2870 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 25. Specific functions, and accordingly utilities, of VGAM2870 correlate with, and may be deduced from, the identity of the host target genes which VGAM2870 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40120] Nucleotide sequences of the VGAM2870 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2870 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2870 are further described hereinbelow with reference to Table 1.

[40121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2870 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40122] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2871 (VGAM2871) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40123] VGAM2871 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2871 was detected is described hereinabove with reference to Figs. 2-8.

[40124] VGAM2871 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 20. VGAM2871 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40125] VGAM2871 gene, herein designated VGAM GENE, encodes a VGAM2871 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2871 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2871 precursor RNA is designated SEQ ID:1942, and is provided hereinbelow with reference to the sequence listing part.

[40126] VGAM2871 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40127] An enzyme complex designated DICER COMPLEX, dices the VGAM2871 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2871 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2871 RNA is designated SEQ ID:5012, and is provided hereinbelow with reference to the sequence listing part.

[40128] VGAM2871 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2871 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2871 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40129] VGAM2871 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2871 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2871 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2871 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2871 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40130] The complementary binding of VGAM2871 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2871 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2871

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2871 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40131] It is appreciated that VGAM2871 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2871 host target genes. The mRNA of each one of this plurality of VGAM2871 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2871 RNA, herein designated VGAM RNA, and which when bound by VGAM2871 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2871 host target proteins.

[40132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2871 gene, herein designated VGAM GENE, on one or more VGAM2871 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40133] It is yet further appreciated that a function of VGAM2871 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2871 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 20. Specific functions, and accordingly utilities, of VGAM2871 correlate with, and may be deduced from, the identity of the host target genes which VGAM2871 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40134] Nucleotide sequences of the VGAM2871 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2871 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2871 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2871 are further described hereinbelow with reference to Table 1.

[40135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2871 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40136] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2872 (VGAM2872) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40137] VGAM2872 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2872 was detected is described hereinabove with reference to Figs. 2-8.

[40138] VGAM2872 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 23. VGAM2872 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[40139] VGAM2872 gene, herein designated VGAM GENE, encodes a VGAM2872 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2872 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2872 precursor RNA is designated SEQ ID:1937, and is provided hereinbelow with reference to the sequence listing part.

[40140] VGAM2872 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40141] An enzyme complex designated DICER COMPLEX, dices the VGAM2872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2872 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2872 RNA is designated SEQ ID:5007, and is provided hereinbelow with reference to the sequence listing part.

[40142] VGAM2872 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2872 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2872 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40143] VGAM2872 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2872 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2872 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2872 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2872 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40144] The complementary binding of VGAM2872 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2872 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2872 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2872 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40145] It is appreciated that VGAM2872 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2872 host target genes. The mRNA of each one of this plurality of VGAM2872 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2872 RNA, herein designated VGAM RNA, and which when bound by VGAM2872 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2872 host target proteins.

[40146] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2872 gene, herein designated VGAM GENE, on one or more VGAM2872 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40147] It is yet further appreciated that a function of VGAM2872 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2872 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 23. Specific functions, and accordingly utilities, of VGAM2872 correlate with, and may be deduced from, the identity of the host target genes which VGAM2872 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40148] Nucleotide sequences of the VGAM2872 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2872 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2872 are further

described hereinbelow with reference to Table 1.

[40149] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2872 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40150] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2873 (VGAM2873) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40151] VGAM2873 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2873 was detected is described hereinabove with reference to Figs. 2-8.

[40152] VGAM2873 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 36. VGAM2873 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40153] VGAM2873 gene, herein designated VGAM GENE, encodes a VGAM2873 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2873 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2873 precursor RNA is designated SEQ ID:1938, and is provided hereinbelow with reference to the sequence listing part.

[40154] VGAM2873 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40155] An enzyme complex designated DICER COMPLEX, dices the VGAM2873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2873 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2873 RNA is designated SEQ ID:5008, and is provided hereinbelow with reference to the sequence listing part.

[40156] VGAM2873 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40157] VGAM2873 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2873 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2873 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40158] The complementary binding of VGAM2873 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2873 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2873 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40159] It is appreciated that VGAM2873 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2873 host target genes. The mRNA of each one of this plurality of VGAM2873 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2873 RNA, herein designated VGAM RNA, and which when bound by VGAM2873 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2873 host target proteins.

[40160] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2873 gene, herein designated VGAM GENE, on one or more VGAM2873 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40161] It is yet further appreciated that a function of VGAM2873 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2873 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 36. Specific functions, and accordingly utilities, of VGAM2873 correlate with, and may be deduced from, the identity of the host target genes which VGAM2873 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40162] Nucleotide sequences of the VGAM2873 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2873 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2873 are further described hereinbelow with reference to Table 1.

[40163] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2873 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40164] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2874 (VGAM2874) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40165] VGAM2874 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2874 was detected is described hereinabove with reference to Figs. 2-8.

[40166] VGAM2874 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 49. VGAM2874 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40167] VGAM2874 gene, herein designated VGAM GENE, encodes

a VGAM2874 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2874 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2874 precursor RNA is designated SEQ ID:1943, and is provided hereinbelow with reference to the sequence listing part.

[40168] VGAM2874 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40169] An enzyme complex designated DICER COMPLEX, dices the VGAM2874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2874 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2874 RNA is designated SEQ ID:5013, and is provided hereinbelow with reference to the sequence listing part.

[40170] VGAM2874 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40171] VGAM2874 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2874 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2874 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40172] The complementary binding of VGAM2874 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2874 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2874 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[40173] It is appreciated that VGAM2874 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2874 host target genes. The mRNA of each one of this plurality of VGAM2874 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2874 RNA, herein designated VGAM RNA, and which when bound by VGAM2874 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2874 host target proteins.

[40174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2874 gene, herein designated VGAM GENE, on one or more VGAM2874 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40175] It is yet further appreciated that a function of VGAM2874 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2874 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 49. Specific functions, and accordingly utilities, of VGAM2874 correlate with, and may be deduced from, the identity of the host target genes which VGAM2874 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40176] Nucleotide sequences of the VGAM2874 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2874 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2874 are further described hereinbelow with reference to Table 1.

[40177] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2874 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40178] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2875 (VGAM2875) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40179] VGAM2875 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2875 was detected is described hereinabove with reference to Figs. 2-8.

[40180] VGAM2875 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 9. VGAM2875 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40181] VGAM2875 gene, herein designated VGAM GENE, encodes a VGAM2875 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2875 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2875 precursor RNA is designated SEQ ID:1944, and is provided hereinbelow with reference to the sequence listing part.

[40182] VGAM2875 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40183] An enzyme complex designated DICER COMPLEX, dices the VGAM2875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2875 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2875 RNA is designated SEQ ID:5014, and is provided hereinbelow with reference to the sequence listing part.

[40184] VGAM2875 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40185] VGAM2875 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2875 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2875 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40186] The complementary binding of VGAM2875 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2875 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2875 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40187] It is appreciated that VGAM2875 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2875 host target genes. The mRNA of each one of this plurality of VGAM2875 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2875 RNA, herein designated VGAM RNA, and which when bound by VGAM2875 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2875 host target proteins.

[40188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2875 gene, herein designated VGAM GENE, on one or more VGAM2875 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40189] It is yet further appreciated that a function of VGAM2875 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2875 include diagnosis, prevention and treatment of viral infection by Human papillomavirus type 9. Specific functions, and accordingly utilities, of VGAM2875 correlate with, and may be deduced from, the identity of the host target genes which VGAM2875 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40190] Nucleotide sequences of the VGAM2875 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2875 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2875 are further described hereinbelow with reference to Table 1.

[40191] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2875 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40192] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2876 (VGAM2876) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40193] VGAM2876 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2876 was detected is described hereinabove with reference to Figs. 2-8.

[40194] VGAM2876 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM2876 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40195] VGAM2876 gene, herein designated VGAM GENE, encodes a VGAM2876 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2876 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2876 precursor RNA is designated SEQ ID:1945, and is provided hereinbelow with reference to the sequence listing part.

[40196] VGAM2876 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40197] An enzyme complex designated DICER COMPLEX, dices the VGAM2876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2876 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2876 RNA is designated SEQ ID:5015, and is provided hereinbelow with reference to the sequence listing part.

[40198] VGAM2876 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40199] VGAM2876 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2876 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2876 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40200] The complementary binding of VGAM2876 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2876 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2876 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40201] It is appreciated that VGAM2876 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2876 host target genes. The mRNA of each one of this plurality of VGAM2876 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2876 RNA, herein designated VGAM RNA, and which when bound by VGAM2876 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2876 host target proteins.

[40202] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2876 gene, herein designated VGAM GENE, on one or more VGAM2876 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40203] It is yet further appreciated that a function of VGAM2876 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2876 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM2876 correlate with, and may be deduced from, the identity of the host target genes which VGAM2876 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40204] Nucleotide sequences of the VGAM2876 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2876 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2876 are further described hereinbelow with reference to Table 1.

[40205] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2876 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40206] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2877 (VGAM2877) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40207] VGAM2877 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2877 was detected is described hereinabove with reference to Figs. 2-8.

[40208] VGAM2877 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM2877 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40209] VGAM2877 gene, herein designated VGAM GENE, encodes a VGAM2877 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2877 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2877 precursor RNA is designated SEQ ID:1946, and is provided hereinbelow with reference to the sequence listing part.

[40210] VGAM2877 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40211] An enzyme complex designated DICER COMPLEX, dices the VGAM2877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2877 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2877 RNA is designated SEQ ID:5016, and is provided hereinbelow with reference to the sequence listing part.

[40212] VGAM2877 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40213] VGAM2877 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2877 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2877 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40214] The complementary binding of VGAM2877 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2877 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2877 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40215] It is appreciated that VGAM2877 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2877 host target genes. The mRNA of each one of this plurality of VGAM2877 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2877 RNA, herein designated VGAM RNA, and which when bound by VGAM2877 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2877 host target proteins.

[40216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2877 gene, herein designated VGAM GENE, on one or more VGAM2877 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40217] It is yet further appreciated that a function of VGAM2877 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2877 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2877 correlate with, and may be deduced from, the identity of the host target genes which VGAM2877 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40218] Nucleotide sequences of the VGAM2877 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2877 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2877 are further described hereinbelow with reference to Table 1.

[40219] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2877 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40220] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2878 (VGAM2878) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40221] VGAM2878 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2878 was detected is described hereinabove with reference to Figs. 2-8.

[40222] VGAM2878 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2878 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40223] VGAM2878 gene, herein designated VGAM GENE, encodes a VGAM2878 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2878 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2878 precursor RNA is designated SEQ ID:1947, and is provided hereinbelow with reference to the sequence listing part.

[40224] VGAM2878 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40225] An enzyme complex designated DICER COMPLEX, dices the VGAM2878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2878 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2878 RNA is designated SEQ ID:5017, and is provided hereinbelow with reference to the sequence listing part.

[40226] VGAM2878 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40227] VGAM2878 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2878 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2878 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40228] The complementary binding of VGAM2878 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2878 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2878 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40229] It is appreciated that VGAM2878 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2878 host target genes. The mRNA of

each one of this plurality of VGAM2878 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2878 RNA, herein designated VGAM RNA, and which when bound by VGAM2878 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2878 host target proteins.

[40230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2878 gene, herein designated VGAM GENE, on one or more VGAM2878 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[40231] It is yet further appreciated that a function of VGAM2878 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2878 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2878 correlate with, and may be deduced from, the identity of the host target genes which VGAM2878 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40232] Nucleotide sequences of the VGAM2878 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2878 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2878 are further described hereinbelow with reference to Table 1.

[40233] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2878 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[40234] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2879 (VGAM2879) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40235] VGAM2879 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2879 was detected is described hereinabove with reference to Figs. 2-8.

[40236] VGAM2879 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aleutian mink disease virus. VGAM2879 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40237] VGAM2879 gene, herein designated VGAM GENE, encodes a VGAM2879 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2879 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2879 precursor RNA is designated SEQ ID:1939, and is provided hereinbelow with reference to the sequence listing part.

[40238] VGAM2879 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40239] An enzyme complex designated DICER COMPLEX, dices the VGAM2879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2879 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2879 RNA is designated SEQ ID:5009, and

is provided hereinbelow with reference to the sequence listing part.

[40240] VGAM2879 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40241] VGAM2879 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2879 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2879 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40242] The complementary binding of VGAM2879 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2879 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2879 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40243] It is appreciated that VGAM2879 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2879 host target genes. The mRNA of each one of this plurality of VGAM2879 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2879 RNA, herein designated VGAM RNA, and which when bound by VGAM2879 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2879 host target proteins.

[40244] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2879 gene, herein designated VGAM GENE, on one or more VGAM2879 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40245] It is yet further appreciated that a function of VGAM2879 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2879 include diagnosis, prevention and treatment of viral infection by Aleutian mink disease virus. Specific functions, and accordingly utilities, of VGAM2879 correlate with, and may be deduced from, the identity of the host target genes which VGAM2879 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40246] Nucleotide sequences of the VGAM2879 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2879 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2879 are further described hereinbelow with reference to Table 1.

[40247] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2879 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40248] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2880 (VGAM2880) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40249] VGAM2880 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2880 was detected is described hereinabove with reference to Figs. 2-8.

[40250] VGAM2880 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2880 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40251] VGAM2880 gene, herein designated VGAM GENE, encodes a VGAM2880 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2880 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2880 precur-

sor RNA is designated SEQ ID:1948, and is provided hereinbelow with reference to the sequence listing part.

[40252] VGAM2880 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40253] An enzyme complex designated DICER COMPLEX, dices the VGAM2880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2880 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2880 RNA is designated SEQ ID:5018, and is provided hereinbelow with reference to the sequence

listing part.

[40254] VGAM2880 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40255] VGAM2880 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2880 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2880 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40256] The complementary binding of VGAM2880 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2880 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2880 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40257] It is appreciated that VGAM2880 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2880 host target genes. The mRNA of each one of this plurality of VGAM2880 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2880 RNA, herein designated VGAM RNA, and which when bound by VGAM2880 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2880 host target proteins.

[40258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2880 gene, herein designated VGAM GENE, on one or more VGAM2880 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40259] It is yet further appreciated that a function of VGAM2880

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2880 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2880 correlate with, and may be deduced from, the identity of the host target genes which VGAM2880 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40260] Nucleotide sequences of the VGAM2880 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2880 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2880 are further described hereinbelow with reference to Table 1.

[40261] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2880 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40262] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2881 (VGAM2881) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40263] VGAM2881 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2881 was detected is described hereinabove with reference to Figs. 2-8.

[40264] VGAM2881 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Banana mild mosaic virus. VGAM2881 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40265] VGAM2881 gene, herein designated VGAM GENE, encodes a VGAM2881 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2881 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2881 precursor RNA is designated SEQ ID:1940, and is provided here-

inbelow with reference to the sequence listing part.

[40266] VGAM2881 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40267] An enzyme complex designated DICER COMPLEX, dices the VGAM2881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2881 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2881 RNA is designated SEQ ID:5010, and is provided hereinbelow with reference to the sequence listing part.

[40268] VGAM2881 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40269] VGAM2881 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2881 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2881 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40270] The complementary binding of VGAM2881 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2881 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2881 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40271] It is appreciated that VGAM2881 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2881 host target genes. The mRNA of each one of this plurality of VGAM2881 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2881 RNA, herein designated VGAM RNA, and which when bound by VGAM2881 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2881 host target proteins.

[40272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2881 gene, herein designated VGAM GENE, on one or more VGAM2881 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40273] It is yet further appreciated that a function of VGAM2881 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2881 include diagnosis, prevention and treatment of viral infection by Banana mild mosaic virus. Specific functions, and accordingly utilities, of VGAM2881 correlate with, and may be deduced from, the identity of the host target genes which VGAM2881 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40274] Nucleotide sequences of the VGAM2881 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2881 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2881 are further described hereinbelow with reference to Table 1.

[40275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2881 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40276] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2882 (VGAM2882) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40277] VGAM2882 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2882 was detected is described hereinabove with reference to Figs. 2-8.

[40278] VGAM2882 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine adenovirus C. VGAM2882 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40279] VGAM2882 gene, herein designated VGAM GENE, encodes a VGAM2882 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2882 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2882 precursor RNA is designated SEQ ID:1949, and is provided hereinbelow with reference to the sequence listing part.

[40280] VGAM2882 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40281] An enzyme complex designated DICER COMPLEX, dices the VGAM2882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2882 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2882 RNA is designated SEQ ID:5019, and is provided hereinbelow with reference to the sequence listing part.

[40282] VGAM2882 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40283] VGAM2882 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2882 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2882 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40284] The complementary binding of VGAM2882 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2882 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2882 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40285] It is appreciated that VGAM2882 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2882 host target genes. The mRNA of each one of this plurality of VGAM2882 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2882 RNA, herein designated VGAM

RNA, and which when bound by VGAM2882 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2882 host target proteins.

[40286] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2882 gene, herein designated VGAM GENE, on one or more VGAM2882 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40287] It is yet further appreciated that a function of VGAM2882 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2882 include diagnosis, prevention and treatment of viral infection by Porcine adenovirus C. Specific functions, and accordingly utilities, of VGAM2882 correlate with, and may be deduced from, the identity of the host target genes which VGAM2882 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40288] Nucleotide sequences of the VGAM2882 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2882 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2882 are further described hereinbelow with reference to Table 1.

[40289] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2882 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40290] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2883 (VGAM2883) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40291] VGAM2883 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2883 was detected is described hereinabove with reference to Figs. 2-8.

[40292] VGAM2883 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2883 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40293] VGAM2883 gene, herein designated VGAM GENE, encodes a VGAM2883 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2883 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2883 precursor RNA is designated SEQ ID:1953, and is provided hereinbelow with reference to the sequence listing part.

[40294] VGAM2883 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40295] An enzyme complex designated DICER COMPLEX, dices the VGAM2883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2883 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2883 RNA is designated SEQ ID:5023, and is provided hereinbelow with reference to the sequence listing part.

[40296] VGAM2883 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2883 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2883 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40297] VGAM2883 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2883 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2883 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2883 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2883 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40298] The complementary binding of VGAM2883 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2883 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2883 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2883 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40299] It is appreciated that VGAM2883 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2883 host target genes. The mRNA of each one of this plurality of VGAM2883 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2883 RNA, herein designated VGAM RNA, and which when bound by VGAM2883 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2883 host target proteins.

[40300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2883 gene, herein designated VGAM GENE, on one or more VGAM2883 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40301] It is yet further appreciated that a function of VGAM2883 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2883 include diagnosis, prevention and

treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2883 correlate with, and may be deduced from, the identity of the host target genes which VGAM2883 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40302] Nucleotide sequences of the VGAM2883 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2883 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2883 are further described hereinbelow with reference to Table 1.

[40303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2883 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40304] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2884 (VGAM2884) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40305] VGAM2884 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2884 was detected is described hereinabove with reference to Figs. 2-8.

[40306] VGAM2884 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus A. VGAM2884 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40307] VGAM2884 gene, herein designated VGAM GENE, encodes a VGAM2884 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2884 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2884 precursor RNA is designated SEQ ID:1950, and is provided hereinbelow with reference to the sequence listing part.

[40308] VGAM2884 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2884 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40309] An enzyme complex designated DICER COMPLEX, dices the VGAM2884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2884 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2884 RNA is designated SEQ ID:5020, and is provided hereinbelow with reference to the sequence listing part.

[40310] VGAM2884 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2884 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2884 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40311] VGAM2884 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2884 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2884 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2884 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2884 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40312] The complementary binding of VGAM2884 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2884 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2884 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2884 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40313] It is appreciated that VGAM2884 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2884 host target genes. The mRNA of each one of this plurality of VGAM2884 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2884 RNA, herein designated VGAM RNA, and which when bound by VGAM2884 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2884 host target proteins.

[40314] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2884 gene, herein designated VGAM GENE, on one or more VGAM2884 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40315] It is yet further appreciated that a function of VGAM2884 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2884 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus A. Specific

functions, and accordingly utilities, of VGAM2884 correlate with, and may be deduced from, the identity of the host target genes which VGAM2884 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40316] Nucleotide sequences of the VGAM2884 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2884 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2884 are further described hereinbelow with reference to Table 1.

[40317] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2884 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40318] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2885 (VGAM2885) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[40319] VGAM2885 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2885 was detected is described hereinabove with reference to Figs. 2-8.

[40320] VGAM2885 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2885 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40321] VGAM2885 gene, herein designated VGAM GENE, encodes a VGAM2885 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2885 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2885 precursor RNA is designated SEQ ID:1951, and is provided hereinbelow with reference to the sequence listing part.

[40322] VGAM2885 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2885 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40323] An enzyme complex designated DICER COMPLEX, dices the VGAM2885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2885 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2885 RNA is designated SEQ ID:5021, and is provided hereinbelow with reference to the sequence listing part.

[40324] VGAM2885 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2885 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2885 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40325] VGAM2885 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2885 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2885 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2885 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2885 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40326] The complementary binding of VGAM2885 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2885 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2885 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2885 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40327] It is appreciated that VGAM2885 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2885 host target genes. The mRNA of each one of this plurality of VGAM2885 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2885 RNA, herein designated VGAM RNA, and which when bound by VGAM2885 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2885 host target proteins.

[40328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2885 gene, herein designated VGAM GENE, on one or more VGAM2885 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40329] It is yet further appreciated that a function of VGAM2885 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2885 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2885 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2885 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40330] Nucleotide sequences of the VGAM2885 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2885 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2885 are further described hereinbelow with reference to Table 1.

[40331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2885 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40332] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2886 (VGAM2886) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[40333] VGAM2886 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2886 was detected is described hereinabove with reference to Figs. 2-8.

[40334] VGAM2886 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2886 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40335] VGAM2886 gene, herein designated VGAM GENE, encodes a VGAM2886 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2886 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2886 precursor RNA is designated SEQ ID:1952, and is provided hereinbelow with reference to the sequence listing part.

[40336] VGAM2886 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40337] An enzyme complex designated DICER COMPLEX, dices the VGAM2886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2886 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2886 RNA is designated SEQ ID:5022, and is provided hereinbelow with reference to the sequence listing part.

[40338] VGAM2886 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40339] VGAM2886 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2886 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2886 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40340] The complementary binding of VGAM2886 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2886 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2886 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40341] It is appreciated that VGAM2886 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2886 host target genes. The mRNA of each one of this plurality of VGAM2886 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2886 RNA, herein designated VGAM RNA, and which when bound by VGAM2886 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2886 host target proteins.

[40342] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2886 gene, herein designated VGAM GENE, on one or more VGAM2886 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40343] It is yet further appreciated that a function of VGAM2886 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2886 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2886 correlate with, and may be deduced from, the identity of the

host target genes which VGAM2886 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40344] Nucleotide sequences of the VGAM2886 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2886 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2886 are further described hereinbelow with reference to Table 1.

[40345] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2886 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40346] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2887 (VGAM2887) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40347] VGAM2887 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2887 was detected is described hereinabove with reference to Figs. 2-8.

[40348] VGAM2887 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2887 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40349] VGAM2887 gene, herein designated VGAM GENE, encodes a VGAM2887 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2887 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2887 precursor RNA is designated SEQ ID:1958, and is provided hereinbelow with reference to the sequence listing part.

[40350] VGAM2887 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40351] An enzyme complex designated DICER COMPLEX, dices the VGAM2887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2887 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2887 RNA is designated SEQ ID:5028, and is provided hereinbelow with reference to the sequence listing part.

[40352] VGAM2887 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40353] VGAM2887 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2887 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2887 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40354] The complementary binding of VGAM2887 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2887 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2887 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40355] It is appreciated that VGAM2887 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2887 host target genes. The mRNA of each one of this plurality of VGAM2887 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2887 RNA, herein designated VGAM RNA, and which when bound by VGAM2887 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2887 host target proteins.

[40356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2887 gene, herein designated VGAM GENE, on one or more VGAM2887 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40357] It is yet further appreciated that a function of VGAM2887 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2887 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2887 correlate with, and may be deduced from, the identity of the host target genes which VGAM2887 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40358] Nucleotide sequences of the VGAM2887 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2887 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2887 are further described hereinbelow with reference to Table 1.

[40359] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2887 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40360] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2888 (VGAM2888) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40361] VGAM2888 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2888 was detected is described hereinabove with reference to Figs. 2-8.

[40362] VGAM2888 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM2888 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40363] VGAM2888 gene, herein designated VGAM GENE, encodes a VGAM2888 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2888 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2888 precursor RNA is designated SEQ ID:1954, and is provided hereinbelow with reference to the sequence listing part.

[40364] VGAM2888 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40365] An enzyme complex designated DICER COMPLEX, dices the VGAM2888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2888 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2888 RNA is designated SEQ ID:5024, and is provided hereinbelow with reference to the sequence listing part.

[40366] VGAM2888 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40367] VGAM2888 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2888 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2888 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[40368] The complementary binding of VGAM2888 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2888 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2888 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40369] It is appreciated that VGAM2888 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2888 host target genes. The mRNA of each one of this plurality of VGAM2888 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2888 RNA, herein designated VGAM RNA, and which when bound by VGAM2888 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2888 host target proteins.

[40370] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2888 gene, herein designated VGAM GENE, on one or more VGAM2888 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40371] It is yet further appreciated that a function of VGAM2888 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2888 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2888 correlate with, and may be deduced from, the identity of the host target genes which VGAM2888 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[40372] Nucleotide sequences of the VGAM2888 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2888 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2888 are further described hereinbelow with reference to Table 1.

[40373] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2888 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40374] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2889 (VGAM2889) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40375] VGAM2889 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2889 was detected is described hereinabove with reference to Figs. 2-8.

[40376] VGAM2889 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2889 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40377] VGAM2889 gene, herein designated VGAM GENE, encodes a VGAM2889 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2889 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2889 precursor RNA is designated SEQ ID:1959, and is provided hereinbelow with reference to the sequence listing part.

[40378] VGAM2889 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40379] An enzyme complex designated DICER COMPLEX, dices the VGAM2889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2889 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2889 RNA is designated SEQ ID:5029, and is provided hereinbelow with reference to the sequence listing part.

[40380] VGAM2889 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[40381] VGAM2889 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2889 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2889 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40382] The complementary binding of VGAM2889 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2889 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2889 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40383] It is appreciated that VGAM2889 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2889 host target genes. The mRNA of each one of this plurality of VGAM2889 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2889 RNA, herein designated VGAM RNA, and which when bound by VGAM2889 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2889 host target proteins.

[40384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2889 gene, herein designated VGAM GENE, on one

or more VGAM2889 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40385] It is yet further appreciated that a function of VGAM2889 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2889 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2889 correlate with, and may be deduced from, the identity of the host target genes which VGAM2889 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40386] Nucleotide sequences of the VGAM2889 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2889 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2889 are further described hereinbelow with reference to Table 1.

[40387] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2889 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40388] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2890 (VGAM2890) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40389] VGAM2890 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2890 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[40390] VGAM2890 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2890 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40391] VGAM2890 gene, herein designated VGAM GENE, encodes a VGAM2890 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2890 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2890 precursor RNA is designated SEQ ID:1955, and is provided hereinbelow with reference to the sequence listing part.

[40392] VGAM2890 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40393] An enzyme complex designated DICER COMPLEX, dices the VGAM2890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2890 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2890 RNA is designated SEQ ID:5025, and is provided hereinbelow with reference to the sequence listing part.

[40394] VGAM2890 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40395] VGAM2890 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2890 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2890 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40396] The complementary binding of VGAM2890 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2890 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2890 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40397] It is appreciated that VGAM2890 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2890 host target genes. The mRNA of each one of this plurality of VGAM2890 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2890 RNA, herein designated VGAM RNA, and which when bound by VGAM2890 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2890 host target proteins.

[40398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2890 gene, herein designated VGAM GENE, on one or more VGAM2890 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40399] It is yet further appreciated that a function of VGAM2890 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2890 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2890 correlate with, and may be deduced from, the identity of the host target genes which VGAM2890 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40400] Nucleotide sequences of the VGAM2890 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2890 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2890 are further described hereinbelow with reference to Table 1.

[40401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2890 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40402] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2891 (VGAM2891) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40403] VGAM2891 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2891 was detected is described hereinabove with reference to Figs. 2-8.

[40404] VGAM2891 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ophiostoma mitovirus 3a. VGAM2891 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40405] VGAM2891 gene, herein designated VGAM GENE, encodes a VGAM2891 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2891 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2891 precursor RNA is designated SEQ ID:1956, and is provided hereinbelow with reference to the sequence listing part.

[40406] VGAM2891 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[40407] An enzyme complex designated DICER COMPLEX, dices the VGAM2891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2891 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2891 RNA is designated SEQ ID:5026, and is provided hereinbelow with reference to the sequence listing part.

[40408] VGAM2891 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40409] VGAM2891 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2891 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2891 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40410] The complementary binding of VGAM2891 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2891 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2891 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40411] It is appreciated that VGAM2891 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2891 host target genes. The mRNA of each one of this plurality of VGAM2891 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2891 RNA, herein designated VGAM RNA, and which when bound by VGAM2891 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2891 host target proteins.

[40412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2891 gene, herein designated VGAM GENE, on one or more VGAM2891 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40413] It is yet further appreciated that a function of VGAM2891 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2891 include diagnosis, prevention and treatment of viral infection by Ophiostoma mitovirus 3a. Specific functions, and accordingly utilities, of VGAM2891 correlate with, and may be deduced from, the identity of the host target genes which VGAM2891 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40414] Nucleotide sequences of the VGAM2891 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2891 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2891 are further described hereinbelow with reference to Table 1.

[40415] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2891 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40416] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2892 (VGAM2892) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40417] VGAM2892 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2892 was detected is described hereinabove with reference to Figs. 2-8.

[40418] VGAM2892 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Lymphocystis disease virus 1. VGAM2892 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40419] VGAM2892 gene, herein designated VGAM GENE, encodes a VGAM2892 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2892 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2892 precursor RNA is designated SEQ ID:1960, and is provided hereinbelow with reference to the sequence listing part.

[40420] VGAM2892 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40421] An enzyme complex designated DICER COMPLEX, dices the VGAM2892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2892 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2892 RNA is designated SEQ ID:5030, and is provided hereinbelow with reference to the sequence listing part.

[40422] VGAM2892 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2892 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2892 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40423] VGAM2892 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2892 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2892 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2892 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2892 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40424] The complementary binding of VGAM2892 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2892 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2892 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2892 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40425] It is appreciated that VGAM2892 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2892 host target genes. The mRNA of each one of this plurality of VGAM2892 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2892 RNA, herein designated VGAM RNA, and which when bound by VGAM2892 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2892 host target proteins.

[40426] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2892 gene, herein designated VGAM GENE, on one or more VGAM2892 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40427] It is yet further appreciated that a function of VGAM2892 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2892 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2892 correlate with, and may be deduced from, the identity of the host target genes which VGAM2892 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40428] Nucleotide sequences of the VGAM2892 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2892 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2892 are further described hereinbelow with reference to Table 1.

[40429] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2892 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40430] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2893 (VGAM2893) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40431] VGAM2893 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2893 was detected is described hereinabove with reference to Figs. 2-8.

[40432] VGAM2893 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover yellow vein virus.

VGAM2893 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40433] VGAM2893 gene, herein designated VGAM GENE, encodes a VGAM2893 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2893 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2893 precursor RNA is designated SEQ ID:1961, and is provided hereinbelow with reference to the sequence listing part.

[40434] VGAM2893 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40435] An enzyme complex designated DICER COMPLEX, dices

the VGAM2893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2893 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2893 RNA is designated SEQ ID:5031, and is provided hereinbelow with reference to the sequence listing part.

[40436] VGAM2893 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2893 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2893 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40437] VGAM2893 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2893 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2893 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2893 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2893 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40438] The complementary binding of VGAM2893 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2893 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2893 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2893 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40439] It is appreciated that VGAM2893 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2893 host target genes. The mRNA of each one of this plurality of VGAM2893 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2893 RNA, herein designated VGAM RNA, and which when bound by VGAM2893 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2893 host target proteins.

[40440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2893 gene, herein designated VGAM GENE, on one or more VGAM2893 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40441] It is yet further appreciated that a function of VGAM2893 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2893 include diagnosis, prevention and treatment of viral infection by Clover yellow vein virus. Specific functions, and accordingly utilities, of VGAM2893 correlate with, and may be deduced from, the identity of the host target genes which VGAM2893 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40442] Nucleotide sequences of the VGAM2893 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2893 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2893 are further described hereinbelow with reference to Table 1.

[40443] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2893 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40444] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2894 (VGAM2894) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40445] VGAM2894 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2894 was detected is described hereinabove with reference to Figs. 2-8.

[40446] VGAM2894 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM2894 host target gene, herein desig-

nated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40447] VGAM2894 gene, herein designated VGAM GENE, encodes a VGAM2894 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2894 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2894 precursor RNA is designated SEQ ID:1957, and is provided hereinbelow with reference to the sequence listing part.

[40448] VGAM2894 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40449] An enzyme complex designated DICER COMPLEX, dices the VGAM2894 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2894 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2894 RNA is designated SEQ ID:5027, and is provided hereinbelow with reference to the sequence listing part.

[40450] VGAM2894 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2894 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2894 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40451] VGAM2894 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2894 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2894 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2894 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2894 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40452] The complementary binding of VGAM2894 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2894 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2894

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2894 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40453] It is appreciated that VGAM2894 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2894 host target genes. The mRNA of each one of this plurality of VGAM2894 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2894 RNA, herein designated VGAM RNA, and which when bound by VGAM2894 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2894 host target proteins.

[40454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2894 gene, herein designated VGAM GENE, on one or more VGAM2894 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40455] It is yet further appreciated that a function of VGAM2894 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2894 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2894 correlate with, and may be deduced from, the identity of the host target genes which VGAM2894 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40456] Nucleotide sequences of the VGAM2894 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2894 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2894 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2894 are further described hereinbelow with reference to Table 1.

[40457] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2894 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40458] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2895 (VGAM2895) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40459] VGAM2895 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2895 was detected is described hereinabove with reference to Figs. 2-8.

[40460] VGAM2895 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple chlorotic leaf spot virus. VGAM2895 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[40461] VGAM2895 gene, herein designated VGAM GENE, encodes a VGAM2895 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2895 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2895 precursor RNA is designated SEQ ID:1966, and is provided hereinbelow with reference to the sequence listing part.

[40462] VGAM2895 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40463] An enzyme complex designated DICER COMPLEX, dices the VGAM2895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2895 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2895 RNA is designated SEQ ID:5036, and is provided hereinbelow with reference to the sequence listing part.

[40464] VGAM2895 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2895 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2895 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40465] VGAM2895 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2895 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2895 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2895 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2895 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40466] The complementary binding of VGAM2895 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2895 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2895 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2895 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40467] It is appreciated that VGAM2895 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2895 host target genes. The mRNA of each one of this plurality of VGAM2895 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2895 RNA, herein designated VGAM RNA, and which when bound by VGAM2895 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2895 host target proteins.

[40468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2895 gene, herein designated VGAM GENE, on one or more VGAM2895 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40469] It is yet further appreciated that a function of VGAM2895 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2895 include diagnosis, prevention and treatment of viral infection by Apple chlorotic leaf spot virus. Specific functions, and accordingly utilities, of VGAM2895 correlate with, and may be deduced from, the identity of the host target genes which VGAM2895 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40470] Nucleotide sequences of the VGAM2895 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2895 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2895 are further

described hereinbelow with reference to Table 1.

[40471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2895 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40472] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2896 (VGAM2896) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40473] VGAM2896 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2896 was detected is described hereinabove with reference to Figs. 2-8.

[40474] VGAM2896 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human respiratory syncytial virus. VGAM2896 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40475] VGAM2896 gene, herein designated VGAM GENE, encodes a VGAM2896 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2896 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2896 precursor RNA is designated SEQ ID:1967, and is provided hereinbelow with reference to the sequence listing part.

[40476] VGAM2896 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40477] An enzyme complex designated DICER COMPLEX, dices the VGAM2896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2896 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2896 RNA is designated SEQ ID:5037, and is provided hereinbelow with reference to the sequence listing part.

[40478] VGAM2896 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40479] VGAM2896 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2896 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2896 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40480] The complementary binding of VGAM2896 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2896 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2896 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40481] It is appreciated that VGAM2896 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2896 host target genes. The mRNA of each one of this plurality of VGAM2896 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2896 RNA, herein designated VGAM RNA, and which when bound by VGAM2896 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2896 host target proteins.

[40482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2896 gene, herein designated VGAM GENE, on one or more VGAM2896 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40483] It is yet further appreciated that a function of VGAM2896 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2896 include diagnosis, prevention and treatment of viral infection by Human respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM2896 correlate with, and may be deduced from, the identity of the host target genes which VGAM2896 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40484] Nucleotide sequences of the VGAM2896 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2896 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2896 are further described hereinbelow with reference to Table 1.

[40485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2896 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40486] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2897 (VGAM2897) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40487] VGAM2897 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2897 was detected is described hereinabove with reference to Figs. 2-8.

[40488] VGAM2897 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Apple latent spherical virus. VGAM2897 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40489] VGAM2897 gene, herein designated VGAM GENE, encodes

a VGAM2897 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2897 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2897 precursor RNA is designated SEQ ID:1968, and is provided hereinbelow with reference to the sequence listing part.

[40490] VGAM2897 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40491] An enzyme complex designated DICER COMPLEX, dices the VGAM2897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2897 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2897 RNA is designated SEQ ID:5038, and is provided hereinbelow with reference to the sequence listing part.

[40492] VGAM2897 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40493] VGAM2897 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2897 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2897 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40494] The complementary binding of VGAM2897 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2897 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2897 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[40495] It is appreciated that VGAM2897 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2897 host target genes. The mRNA of each one of this plurality of VGAM2897 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2897 RNA, herein designated VGAM RNA, and which when bound by VGAM2897 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2897 host target proteins.

[40496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2897 gene, herein designated VGAM GENE, on one or more VGAM2897 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40497] It is yet further appreciated that a function of VGAM2897 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2897 include diagnosis, prevention and treatment of viral infection by Apple latent spherical virus. Specific functions, and accordingly utilities, of VGAM2897 correlate with, and may be deduced from, the identity of the host target genes which VGAM2897 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40498] Nucleotide sequences of the VGAM2897 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2897 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2897 are further described hereinbelow with reference to Table 1.

[40499] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2897 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40500] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2898 (VGAM2898) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40501] VGAM2898 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2898 was detected is described hereinabove with reference to Figs. 2-8.

[40502] VGAM2898 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine herpesvirus 7. VGAM2898 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40503] VGAM2898 gene, herein designated VGAM GENE, encodes a VGAM2898 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2898 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2898 precursor RNA is designated SEQ ID:1969, and is provided hereinbelow with reference to the sequence listing part.

[40504] VGAM2898 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40505] An enzyme complex designated DICER COMPLEX, dices the VGAM2898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2898 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2898 RNA is designated SEQ ID:5039, and is provided hereinbelow with reference to the sequence listing part.

[40506] VGAM2898 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40507] VGAM2898 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2898 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2898 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40508] The complementary binding of VGAM2898 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2898 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2898 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40509] It is appreciated that VGAM2898 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2898 host target genes. The mRNA of each one of this plurality of VGAM2898 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2898 RNA, herein designated VGAM RNA, and which when bound by VGAM2898 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2898 host target proteins.

[40510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2898 gene, herein designated VGAM GENE, on one or more VGAM2898 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40511] It is yet further appreciated that a function of VGAM2898 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2898 include diagnosis, prevention and treatment of viral infection by Cercopithecine herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2898 correlate with, and may be deduced from, the identity of the host target genes which VGAM2898 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40512] Nucleotide sequences of the VGAM2898 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2898 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2898 are further described hereinbelow with reference to Table 1.

[40513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2898 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40514] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2899 (VGAM2899) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40515] VGAM2899 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2899 was detected is described hereinabove with reference to Figs. 2-8.

[40516] VGAM2899 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1. VGAM2899 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40517] VGAM2899 gene, herein designated VGAM GENE, encodes a VGAM2899 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2899 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2899 precursor RNA is designated SEQ ID:1973, and is provided hereinbelow with reference to the sequence listing part.

[40518] VGAM2899 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40519] An enzyme complex designated DICER COMPLEX, dices the VGAM2899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2899 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2899 RNA is designated SEQ ID:5043, and is provided hereinbelow with reference to the sequence listing part.

[40520] VGAM2899 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40521] VGAM2899 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2899 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2899 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40522] The complementary binding of VGAM2899 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2899 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2899 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40523] It is appreciated that VGAM2899 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2899 host target genes. The mRNA of each one of this plurality of VGAM2899 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2899 RNA, herein designated VGAM RNA, and which when bound by VGAM2899 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2899 host target proteins.

[40524] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2899 gene, herein designated VGAM GENE, on one or more VGAM2899 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40525] It is yet further appreciated that a function of VGAM2899 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2899 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM2899 correlate with, and may be deduced from, the identity of the host target genes which VGAM2899 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40526] Nucleotide sequences of the VGAM2899 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2899 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2899 are further described hereinbelow with reference to Table 1.

[40527] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2899 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40528] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2900 (VGAM2900) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40529] VGAM2900 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2900 was detected is described hereinabove with reference to Figs. 2-8.

[40530] VGAM2900 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ovine adenovirus A. VGAM2900 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40531] VGAM2900 gene, herein designated VGAM GENE, encodes a VGAM2900 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2900 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2900 precursor RNA is designated SEQ ID:1962, and is provided hereinbelow with reference to the sequence listing part.

[40532] VGAM2900 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40533] An enzyme complex designated DICER COMPLEX, dices the VGAM2900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2900 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2900 RNA is designated SEQ ID:5032, and is provided hereinbelow with reference to the sequence listing part.

[40534] VGAM2900 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40535] VGAM2900 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2900 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2900 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40536] The complementary binding of VGAM2900 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2900 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2900 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40537] It is appreciated that VGAM2900 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2900 host target genes. The mRNA of each one of this plurality of VGAM2900 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2900 RNA, herein designated VGAM RNA, and which when bound by VGAM2900 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2900 host target proteins.

[40538] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2900 gene, herein designated VGAM GENE, on one or more VGAM2900 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40539] It is yet further appreciated that a function of VGAM2900 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2900 include diagnosis, prevention and treatment of viral infection by Ovine adenovirus A. Specific functions, and accordingly utilities, of VGAM2900 correlate with, and may be deduced from, the identity of the host target genes which VGAM2900 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40540] Nucleotide sequences of the VGAM2900 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2900 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2900 are further described hereinbelow with reference to Table 1.

[40541] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2900 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40542] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2901 (VGAM2901) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40543] VGAM2901 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2901 was detected is described hereinabove with reference to Figs. 2-8.

[40544] VGAM2901 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sugarcane striate mosaic associated virus. VGAM2901 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40545] VGAM2901 gene, herein designated VGAM GENE, encodes a VGAM2901 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2901 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2901 precursor RNA is designated SEQ ID:1963, and is provided hereinbelow with reference to the sequence listing part.

[40546] VGAM2901 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40547] An enzyme complex designated DICER COMPLEX, dices the VGAM2901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2901 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide se-

quence of VGAM2901 RNA is designated SEQ ID:5033, and is provided hereinbelow with reference to the sequence listing part.

[40548] VGAM2901 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40549] VGAM2901 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2901 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2901 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40550] The complementary binding of VGAM2901 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2901 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2901 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40551] It is appreciated that VGAM2901 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2901 host target genes. The mRNA of

each one of this plurality of VGAM2901 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2901 RNA, herein designated VGAM RNA, and which when bound by VGAM2901 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2901 host target proteins.

[40552] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2901 gene, herein designated VGAM GENE, on one or more VGAM2901 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[40553] It is yet further appreciated that a function of VGAM2901 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2901 include diagnosis, prevention and treatment of viral infection by Sugarcane striate mosaic associated virus. Specific functions, and accordingly utilities, of VGAM2901 correlate with, and may be deduced from, the identity of the host target genes which VGAM2901 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40554] Nucleotide sequences of the VGAM2901 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2901 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2901 are further described hereinbelow with reference to Table 1.

[40555] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2901 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[40556] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2902 (VGAM2902) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40557] VGAM2902 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2902 was detected is described hereinabove with reference to Figs. 2-8.

[40558] VGAM2902 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2902 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40559] VGAM2902 gene, herein designated VGAM GENE, encodes a VGAM2902 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2902 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2902 precursor RNA is designated SEQ ID:1964, and is provided hereinbelow with reference to the sequence listing part.

[40560] VGAM2902 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40561] An enzyme complex designated DICER COMPLEX, dices the VGAM2902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2902 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2902 RNA is designated SEQ ID:5034, and

is provided hereinbelow with reference to the sequence listing part.

[40562] VGAM2902 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40563] VGAM2902 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2902 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2902 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40564] The complementary binding of VGAM2902 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2902 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2902 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40565] It is appreciated that VGAM2902 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2902 host target genes. The mRNA of each one of this plurality of VGAM2902 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2902 RNA, herein designated VGAM RNA, and which when bound by VGAM2902 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2902 host target proteins.

[40566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2902 gene, herein designated VGAM GENE, on one or more VGAM2902 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40567] It is yet further appreciated that a function of VGAM2902 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2902 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2902 correlate with, and may be deduced from, the identity of the host target genes which VGAM2902 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40568] Nucleotide sequences of the VGAM2902 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2902 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2902 are further described hereinbelow with reference to Table 1.

[40569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2902 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40570] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2903 (VGAM2903) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40571] VGAM2903 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2903 was detected is described hereinabove with reference to Figs. 2-8.

[40572] VGAM2903 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry necrotic rusty mottle virus. VGAM2903 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40573] VGAM2903 gene, herein designated VGAM GENE, encodes a VGAM2903 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2903 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2903 precur-

sor RNA is designated SEQ ID:1970, and is provided hereinbelow with reference to the sequence listing part.

[40574] VGAM2903 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40575] An enzyme complex designated DICER COMPLEX, dices the VGAM2903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2903 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2903 RNA is designated SEQ ID:5040, and is provided hereinbelow with reference to the sequence

listing part.

[40576] VGAM2903 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40577] VGAM2903 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2903 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2903 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40578] The complementary binding of VGAM2903 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2903 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2903 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40579] It is appreciated that VGAM2903 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2903 host target genes. The mRNA of each one of this plurality of VGAM2903 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2903 RNA, herein designated VGAM RNA, and which when bound by VGAM2903 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2903 host target proteins.

[40580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2903 gene, herein designated VGAM GENE, on one or more VGAM2903 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40581] It is yet further appreciated that a function of VGAM2903

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2903 include diagnosis, prevention and treatment of viral infection by Cherry necrotic rusty mottle virus. Specific functions, and accordingly utilities, of VGAM2903 correlate with, and may be deduced from, the identity of the host target genes which VGAM2903 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40582] Nucleotide sequences of the VGAM2903 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2903 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2903 are further described hereinbelow with reference to Table 1.

[40583] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2903 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40584] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2904 (VGAM2904) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40585] VGAM2904 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2904 was detected is described hereinabove with reference to Figs. 2-8.

[40586] VGAM2904 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2904 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40587] VGAM2904 gene, herein designated VGAM GENE, encodes a VGAM2904 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2904 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2904 precursor RNA is designated SEQ ID:1965, and is provided hereinbelow with reference to the sequence listing part.

[40588] VGAM2904 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40589] An enzyme complex designated DICER COMPLEX, dices the VGAM2904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2904 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2904 RNA is designated SEQ ID:5035, and is provided hereinbelow with reference to the sequence listing part.

[40590] VGAM2904 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40591] VGAM2904 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2904 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2904 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40592] The complementary binding of VGAM2904 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2904 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2904 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40593] It is appreciated that VGAM2904 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2904 host target genes. The mRNA of each one of this plurality of VGAM2904 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2904 RNA, herein designated VGAM

RNA, and which when bound by VGAM2904 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2904 host target proteins.

[40594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2904 gene, herein designated VGAM GENE, on one or more VGAM2904 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40595] It is yet further appreciated that a function of VGAM2904 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2904 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2904 correlate with, and may be deduced from, the identity of the host target genes which VGAM2904 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40596] Nucleotide sequences of the VGAM2904 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2904 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2904 are further described hereinbelow with reference to Table 1.

[40597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2904 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40598] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2905 (VGAM2905) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40599] VGAM2905 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2905 was detected is described hereinabove with reference to Figs. 2-8.

[40600] VGAM2905 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human papillomavirus type 15. VGAM2905 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40601] VGAM2905 gene, herein designated VGAM GENE, encodes a VGAM2905 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2905 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2905 precursor RNA is designated SEQ ID:1974, and is provided hereinbelow with reference to the sequence listing part.

[40602] VGAM2905 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40603] An enzyme complex designated DICER COMPLEX, dices the VGAM2905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2905 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2905 RNA is designated SEQ ID:5044, and is provided hereinbelow with reference to the sequence listing part.

[40604] VGAM2905 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2905 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2905 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40605] VGAM2905 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2905 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2905 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2905 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2905 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40606] The complementary binding of VGAM2905 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2905 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2905 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2905 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40607] It is appreciated that VGAM2905 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2905 host target genes. The mRNA of each one of this plurality of VGAM2905 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2905 RNA, herein designated VGAM RNA, and which when bound by VGAM2905 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2905 host target proteins.

[40608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2905 gene, herein designated VGAM GENE, on one or more VGAM2905 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40609] It is yet further appreciated that a function of VGAM2905 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2905 include diagnosis, prevention and

treatment of viral infection by Human papillomavirus type 15. Specific functions, and accordingly utilities, of VGAM2905 correlate with, and may be deduced from, the identity of the host target genes which VGAM2905 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40610] Nucleotide sequences of the VGAM2905 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2905 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2905 are further described hereinbelow with reference to Table 1.

[40611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2905 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40612] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2906 (VGAM2906) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40613] VGAM2906 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2906 was detected is described hereinabove with reference to Figs. 2-8.

[40614] VGAM2906 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2906 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40615] VGAM2906 gene, herein designated VGAM GENE, encodes a VGAM2906 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2906 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2906 precursor RNA is designated SEQ ID:1971, and is provided hereinbelow with reference to the sequence listing part.

[40616] VGAM2906 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2906 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40617] An enzyme complex designated DICER COMPLEX, dices the VGAM2906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2906 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2906 RNA is designated SEQ ID:5041, and is provided hereinbelow with reference to the sequence listing part.

[40618] VGAM2906 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2906 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2906 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40619] VGAM2906 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2906 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2906 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2906 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2906 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40620] The complementary binding of VGAM2906 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2906 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2906 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2906 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40621] It is appreciated that VGAM2906 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2906 host target genes. The mRNA of each one of this plurality of VGAM2906 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2906 RNA, herein designated VGAM RNA, and which when bound by VGAM2906 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2906 host target proteins.

[40622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2906 gene, herein designated VGAM GENE, on one or more VGAM2906 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40623] It is yet further appreciated that a function of VGAM2906 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2906 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Spe-

cific functions, and accordingly utilities, of VGAM2906 correlate with, and may be deduced from, the identity of the host target genes which VGAM2906 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40624] Nucleotide sequences of the VGAM2906 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2906 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2906 are further described hereinbelow with reference to Table 1.

[40625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2906 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40626] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2907 (VGAM2907) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[40627] VGAM2907 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2907 was detected is described hereinabove with reference to Figs. 2-8.

[40628] VGAM2907 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco etch virus. VGAM2907 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40629] VGAM2907 gene, herein designated VGAM GENE, encodes a VGAM2907 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2907 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2907 precursor RNA is designated SEQ ID:1972, and is provided hereinbelow with reference to the sequence listing part.

[40630] VGAM2907 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2907 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40631] An enzyme complex designated DICER COMPLEX, dices the VGAM2907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2907 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2907 RNA is designated SEQ ID:5042, and is provided hereinbelow with reference to the sequence listing part.

[40632] VGAM2907 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2907 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2907 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40633] VGAM2907 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2907 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2907 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2907 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2907 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40634] The complementary binding of VGAM2907 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2907 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2907 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2907 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40635] It is appreciated that VGAM2907 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2907 host target genes. The mRNA of each one of this plurality of VGAM2907 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2907 RNA, herein designated VGAM RNA, and which when bound by VGAM2907 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2907 host target proteins.

[40636] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2907 gene, herein designated VGAM GENE, on one or more VGAM2907 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40637] It is yet further appreciated that a function of VGAM2907 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2907 include diagnosis, prevention and treatment of viral infection by Tobacco etch virus. Specific functions, and accordingly utilities, of VGAM2907 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2907 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40638] Nucleotide sequences of the VGAM2907 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2907 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2907 are further described hereinbelow with reference to Table 1.

[40639] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2907 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40640] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2908 (VGAM2908) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[40641] VGAM2908 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2908 was detected is described hereinabove with reference to Figs. 2-8.

[40642] VGAM2908 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2908 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40643] VGAM2908 gene, herein designated VGAM GENE, encodes a VGAM2908 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2908 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2908 precursor RNA is designated SEQ ID:1981, and is provided hereinbelow with reference to the sequence listing part.

[40644] VGAM2908 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40645] An enzyme complex designated DICER COMPLEX, dices the VGAM2908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2908 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2908 RNA is designated SEQ ID:5051, and is provided hereinbelow with reference to the sequence listing part.

[40646] VGAM2908 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40647] VGAM2908 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2908 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2908 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40648] The complementary binding of VGAM2908 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2908 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2908 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40649] It is appreciated that VGAM2908 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2908 host target genes. The mRNA of each one of this plurality of VGAM2908 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2908 RNA, herein designated VGAM RNA, and which when bound by VGAM2908 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2908 host target proteins.

[40650] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2908 gene, herein designated VGAM GENE, on one or more VGAM2908 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40651] It is yet further appreciated that a function of VGAM2908 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2908 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2908 correlate with, and may be deduced

from, the identity of the host target genes which VGAM2908 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40652] Nucleotide sequences of the VGAM2908 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2908 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2908 are further described hereinbelow with reference to Table 1.

[40653] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2908 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40654] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2909 (VGAM2909) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40655] VGAM2909 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2909 was detected is described hereinabove with reference to Figs. 2-8.

[40656] VGAM2909 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Common chimpanzee papillomavirus 1. VGAM2909 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40657] VGAM2909 gene, herein designated VGAM GENE, encodes a VGAM2909 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2909 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2909 precursor RNA is designated SEQ ID:1975, and is provided hereinbelow with reference to the sequence listing part.

[40658] VGAM2909 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40659] An enzyme complex designated DICER COMPLEX, dices the VGAM2909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2909 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2909 RNA is designated SEQ ID:5045, and is provided hereinbelow with reference to the sequence listing part.

[40660] VGAM2909 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40661] VGAM2909 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2909 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2909 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40662] The complementary binding of VGAM2909 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2909 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2909 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40663] It is appreciated that VGAM2909 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2909 host target genes. The mRNA of each one of this plurality of VGAM2909 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2909 RNA, herein designated VGAM RNA, and which when bound by VGAM2909 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2909 host target proteins.

[40664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2909 gene, herein designated VGAM GENE, on one or more VGAM2909 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40665] It is yet further appreciated that a function of VGAM2909 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2909 include diagnosis, prevention and treatment of viral infection by Common chimpanzee papillomavirus 1. Specific functions, and accordingly utilities, of VGAM2909 correlate with, and may be deduced from, the identity of the host target genes which

VGAM2909 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40666] Nucleotide sequences of the VGAM2909 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2909 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2909 are further described hereinbelow with reference to Table 1.

[40667] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2909 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40668] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2910 (VGAM2910) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40669] VGAM2910 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2910 was detected is described hereinabove with reference to Figs. 2-8.

[40670] VGAM2910 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM2910 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40671] VGAM2910 gene, herein designated VGAM GENE, encodes a VGAM2910 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2910 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2910 precursor RNA is designated SEQ ID:1982, and is provided hereinbelow with reference to the sequence listing part.

[40672] VGAM2910 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40673] An enzyme complex designated DICER COMPLEX, dices the VGAM2910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2910 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2910 RNA is designated SEQ ID:5052, and is provided hereinbelow with reference to the sequence listing part.

[40674] VGAM2910 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40675] VGAM2910 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2910 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2910 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[40676] The complementary binding of VGAM2910 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2910 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2910 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40677] It is appreciated that VGAM2910 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2910 host target genes. The mRNA of each one of this plurality of VGAM2910 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2910 RNA, herein designated VGAM RNA, and which when bound by VGAM2910 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2910 host target proteins.

[40678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2910 gene, herein designated VGAM GENE, on one or more VGAM2910 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40679] It is yet further appreciated that a function of VGAM2910 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2910 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2910 correlate with, and may be deduced from, the identity of the host target genes which VGAM2910 binds and inhibits, and the function of these host target

genes, as elaborated hereinbelow.

[40680] Nucleotide sequences of the VGAM2910 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2910 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2910 are further described hereinbelow with reference to Table 1.

[40681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2910 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40682] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2911 (VGAM2911) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40683] VGAM2911 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2911 was detected is described hereinabove with reference to Figs. 2-8.

[40684] VGAM2911 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2911 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40685] VGAM2911 gene, herein designated VGAM GENE, encodes a VGAM2911 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2911 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2911 precursor RNA is designated SEQ ID:1983, and is provided hereinbelow with reference to the sequence listing part.

[40686] VGAM2911 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40687] An enzyme complex designated DICER COMPLEX, dices the VGAM2911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2911 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2911 RNA is designated SEQ ID:5053, and is provided hereinbelow with reference to the sequence listing part.

[40688] VGAM2911 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[40689] VGAM2911 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2911 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2911 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40690] The complementary binding of VGAM2911 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2911 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2911 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40691] It is appreciated that VGAM2911 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2911 host target genes. The mRNA of each one of this plurality of VGAM2911 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2911 RNA, herein designated VGAM RNA, and which when bound by VGAM2911 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2911 host target proteins.

[40692] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2911 gene, herein designated VGAM GENE, on one

or more VGAM2911 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40693] It is yet further appreciated that a function of VGAM2911 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2911 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2911 correlate with, and may be deduced from, the identity of the host target genes which VGAM2911 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40694] Nucleotide sequences of the VGAM2911 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2911 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2911 are further described hereinbelow with reference to Table 1.

[40695] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2911 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40696] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2912 (VGAM2912) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40697] VGAM2912 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2912 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[40698] VGAM2912 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2912 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40699] VGAM2912 gene, herein designated VGAM GENE, encodes a VGAM2912 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2912 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2912 precursor RNA is designated SEQ ID:1976, and is provided hereinbelow with reference to the sequence listing part.

[40700] VGAM2912 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40701] An enzyme complex designated DICER COMPLEX, dices the VGAM2912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2912 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2912 RNA is designated SEQ ID:5046, and is provided hereinbelow with reference to the sequence listing part.

[40702] VGAM2912 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40703] VGAM2912 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2912 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2912 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40704] The complementary binding of VGAM2912 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2912 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2912 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40705] It is appreciated that VGAM2912 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2912 host target genes. The mRNA of each one of this plurality of VGAM2912 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2912 RNA, herein designated VGAM RNA, and which when bound by VGAM2912 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2912 host target proteins.

[40706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2912 gene, herein designated VGAM GENE, on one or more VGAM2912 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40707] It is yet further appreciated that a function of VGAM2912 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2912 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2912 correlate with, and may be deduced from, the identity of the host target genes which VGAM2912 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40708] Nucleotide sequences of the VGAM2912 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2912 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2912 are further described hereinbelow with reference to Table 1.

[40709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2912 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40710] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2913 (VGAM2913) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40711] VGAM2913 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2913 was detected is described hereinabove with reference to Figs. 2-8.

[40712] VGAM2913 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato virus Y. VGAM2913 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40713] VGAM2913 gene, herein designated VGAM GENE, encodes a VGAM2913 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2913 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2913 precursor RNA is designated SEQ ID:1984, and is provided hereinbelow with reference to the sequence listing part.

[40714] VGAM2913 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[40715] An enzyme complex designated DICER COMPLEX, dices the VGAM2913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2913 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2913 RNA is designated SEQ ID:5054, and is provided hereinbelow with reference to the sequence listing part.

[40716] VGAM2913 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40717] VGAM2913 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2913 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2913 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40718] The complementary binding of VGAM2913 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2913 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2913 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40719] It is appreciated that VGAM2913 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2913 host target genes. The mRNA of each one of this plurality of VGAM2913 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2913 RNA, herein designated VGAM RNA, and which when bound by VGAM2913 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2913 host target proteins.

[40720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2913 gene, herein designated VGAM GENE, on one or more VGAM2913 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40721] It is yet further appreciated that a function of VGAM2913 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2913 include diagnosis, prevention and treatment of viral infection by Potato virus Y. Specific functions, and accordingly utilities, of VGAM2913 correlate with, and may be deduced from, the identity of the host target genes which VGAM2913 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40722] Nucleotide sequences of the VGAM2913 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2913 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2913 are further described hereinbelow with reference to Table 1.

[40723] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2913 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40724] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2914 (VGAM2914) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40725] VGAM2914 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2914 was detected is described hereinabove with reference to Figs. 2-8.

[40726] VGAM2914 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of African swine fever virus. VGAM2914 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40727] VGAM2914 gene, herein designated VGAM GENE, encodes a VGAM2914 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2914 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2914 precursor RNA is designated SEQ ID:1985, and is provided hereinbelow with reference to the sequence listing part.

[40728] VGAM2914 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40729] An enzyme complex designated DICER COMPLEX, dices the VGAM2914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2914 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2914 RNA is designated SEQ ID:5055, and is provided hereinbelow with reference to the sequence listing part.

[40730] VGAM2914 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2914 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2914 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40731] VGAM2914 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2914 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2914 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2914 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2914 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40732] The complementary binding of VGAM2914 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2914 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2914 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2914 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40733] It is appreciated that VGAM2914 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2914 host target genes. The mRNA of each one of this plurality of VGAM2914 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2914 RNA, herein designated VGAM RNA, and which when bound by VGAM2914 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2914 host target proteins.

[40734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2914 gene, herein designated VGAM GENE, on one or more VGAM2914 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40735] It is yet further appreciated that a function of VGAM2914 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2914 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2914 correlate with, and may be deduced from, the identity of the host target genes which VGAM2914 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40736] Nucleotide sequences of the VGAM2914 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2914 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2914 are further described hereinbelow with reference to Table 1.

[40737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2914 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40738] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2915 (VGAM2915) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40739] VGAM2915 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2915 was detected is described hereinabove with reference to Figs. 2-8.

[40740] VGAM2915 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute bee paralysis

virus. VGAM2915 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40741] VGAM2915 gene, herein designated VGAM GENE, encodes a VGAM2915 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2915 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2915 precursor RNA is designated SEQ ID:1977, and is provided hereinbelow with reference to the sequence listing part.

[40742] VGAM2915 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40743] An enzyme complex designated DICER COMPLEX, dices

the VGAM2915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2915 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2915 RNA is designated SEQ ID:5047, and is provided hereinbelow with reference to the sequence listing part.

[40744] VGAM2915 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2915 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2915 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40745] VGAM2915 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2915 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2915 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2915 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2915 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40746] The complementary binding of VGAM2915 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2915 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2915 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2915 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40747] It is appreciated that VGAM2915 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2915 host target genes. The mRNA of each one of this plurality of VGAM2915 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2915 RNA, herein designated VGAM RNA, and which when bound by VGAM2915 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2915 host target proteins.

[40748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2915 gene, herein designated VGAM GENE, on one or more VGAM2915 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40749] It is yet further appreciated that a function of VGAM2915 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2915 include diagnosis, prevention and treatment of viral infection by Acute bee paralysis virus. Specific functions, and accordingly utilities, of VGAM2915 correlate with, and may be deduced from, the identity of the host target genes which VGAM2915 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40750] Nucleotide sequences of the VGAM2915 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2915 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2915 are further described hereinbelow with reference to Table 1.

[40751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2915 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40752] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2916 (VGAM2916) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40753] VGAM2916 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2916 was detected is described hereinabove with reference to Figs. 2-8.

[40754] VGAM2916 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 6. VGAM2916 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[40755] VGAM2916 gene, herein designated VGAM GENE, encodes a VGAM2916 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2916 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2916 precursor RNA is designated SEQ ID:1986, and is provided hereinbelow with reference to the sequence listing part.

[40756] VGAM2916 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40757] An enzyme complex designated DICER COMPLEX, dices the VGAM2916 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2916 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2916 RNA is designated SEQ ID:5056, and is provided hereinbelow with reference to the sequence listing part.

[40758] VGAM2916 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2916 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2916 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40759] VGAM2916 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2916 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2916 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2916 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2916 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40760] The complementary binding of VGAM2916 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2916 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2916

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2916 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40761] It is appreciated that VGAM2916 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2916 host target genes. The mRNA of each one of this plurality of VGAM2916 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2916 RNA, herein designated VGAM RNA, and which when bound by VGAM2916 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2916 host target proteins.

[40762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2916 gene, herein designated VGAM GENE, on one or more VGAM2916 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40763] It is yet further appreciated that a function of VGAM2916 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2916 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 6. Specific functions, and accordingly utilities, of VGAM2916 correlate with, and may be deduced from, the identity of the host target genes which VGAM2916 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40764] Nucleotide sequences of the VGAM2916 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2916 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2916 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2916 are further described hereinbelow with reference to Table 1.

[40765] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2916 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40766] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2917 (VGAM2917) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40767] VGAM2917 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2917 was detected is described hereinabove with reference to Figs. 2-8.

[40768] VGAM2917 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 2. VGAM2917 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[40769] VGAM2917 gene, herein designated VGAM GENE, encodes a VGAM2917 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2917 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2917 precursor RNA is designated SEQ ID:1978, and is provided hereinbelow with reference to the sequence listing part.

[40770] VGAM2917 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40771] An enzyme complex designated DICER COMPLEX, dices the VGAM2917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2917 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2917 RNA is designated SEQ ID:5048, and is provided hereinbelow with reference to the sequence listing part.

[40772] VGAM2917 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2917 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2917 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40773] VGAM2917 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2917 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2917 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2917 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2917 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40774] The complementary binding of VGAM2917 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2917 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2917 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2917 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40775] It is appreciated that VGAM2917 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2917 host target genes. The mRNA of each one of this plurality of VGAM2917 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2917 RNA, herein designated VGAM RNA, and which when bound by VGAM2917 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2917 host target proteins.

[40776] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2917 gene, herein designated VGAM GENE, on one or more VGAM2917 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40777] It is yet further appreciated that a function of VGAM2917 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2917 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2917 correlate with, and may be deduced from, the identity of the host target genes which VGAM2917 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40778] Nucleotide sequences of the VGAM2917 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2917 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2917 are further

described hereinbelow with reference to Table 1.

[40779] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2917 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40780] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2918 (VGAM2918) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40781] VGAM2918 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2918 was detected is described hereinabove with reference to Figs. 2-8.

[40782] VGAM2918 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2918 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40783] VGAM2918 gene, herein designated VGAM GENE, encodes

a VGAM2918 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2918 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2918 precursor RNA is designated SEQ ID:2625, and is provided hereinbelow with reference to the sequence listing part.

[40784] VGAM2918 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40785] An enzyme complex designated DICER COMPLEX, dices the VGAM2918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2918 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2918 RNA is designated SEQ ID:5695, and is provided hereinbelow with reference to the sequence listing part.

[40786] VGAM2918 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40787] VGAM2918 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2918 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2918 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40788] The complementary binding of VGAM2918 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2918 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2918 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[40789] It is appreciated that VGAM2918 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2918 host target genes. The mRNA of each one of this plurality of VGAM2918 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2918 RNA, herein designated VGAM RNA, and which when bound by VGAM2918 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2918 host target proteins.

[40790] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2918 gene, herein designated VGAM GENE, on one or more VGAM2918 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40791] It is yet further appreciated that a function of VGAM2918 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2918 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2918 correlate with, and may be deduced from, the identity of the host target genes which VGAM2918 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40792] Nucleotide sequences of the VGAM2918 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2918 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2918 are further described hereinbelow with reference to Table 1.

[40793] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2918 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40794] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2919 (VGAM2919) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40795] VGAM2919 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2919 was detected is described hereinabove with reference to Figs. 2-8.

[40796] VGAM2919 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Meleagrid herpesvirus 1. VGAM2919 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40797] VGAM2919 gene, herein designated VGAM GENE, encodes a VGAM2919 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2919 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2919 precursor RNA is designated SEQ ID:2626, and is provided hereinbelow with reference to the sequence listing part.

[40798] VGAM2919 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40799] An enzyme complex designated DICER COMPLEX, dices the VGAM2919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2919 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2919 RNA is designated SEQ ID:5696, and is provided hereinbelow with reference to the sequence listing part.

[40800] VGAM2919 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40801] VGAM2919 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2919 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2919 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40802] The complementary binding of VGAM2919 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2919 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2919 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40803] It is appreciated that VGAM2919 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2919 host target genes. The mRNA of each one of this plurality of VGAM2919 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2919 RNA, herein designated VGAM RNA, and which when bound by VGAM2919 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2919 host target proteins.

[40804] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2919 gene, herein designated VGAM GENE, on one or more VGAM2919 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40805] It is yet further appreciated that a function of VGAM2919 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2919 include diagnosis, prevention and treatment of viral infection by Meleagrid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2919 correlate with, and may be deduced from, the identity of the host target genes which VGAM2919 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40806] Nucleotide sequences of the VGAM2919 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2919 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2919 are further described hereinbelow with reference to Table 1.

[40807] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2919 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40808] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2920 (VGAM2920) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40809] VGAM2920 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2920 was detected is described hereinabove with reference to Figs. 2-8.

[40810] VGAM2920 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox virus. VGAM2920 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40811] VGAM2920 gene, herein designated VGAM GENE, encodes a VGAM2920 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2920 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2920 precursor RNA is designated SEQ ID:1979, and is provided hereinbelow with reference to the sequence listing part.

[40812] VGAM2920 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40813] An enzyme complex designated DICER COMPLEX, dices the VGAM2920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2920 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2920 RNA is designated SEQ ID:5049, and is provided hereinbelow with reference to the sequence listing part.

[40814] VGAM2920 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40815] VGAM2920 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2920 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2920 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40816] The complementary binding of VGAM2920 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2920 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2920 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40817] It is appreciated that VGAM2920 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2920 host target genes. The mRNA of each one of this plurality of VGAM2920 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2920 RNA, herein designated VGAM RNA, and which when bound by VGAM2920 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2920 host target proteins.

[40818] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2920 gene, herein designated VGAM GENE, on one or more VGAM2920 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40819] It is yet further appreciated that a function of VGAM2920 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2920 include diagnosis, prevention and treatment of viral infection by Fowlpox virus. Specific functions, and accordingly utilities, of VGAM2920 correlate with, and may be deduced from, the identity of the host target genes which VGAM2920 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40820] Nucleotide sequences of the VGAM2920 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2920 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2920 are further described hereinbelow with reference to Table 1.

[40821] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2920 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40822] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2921 (VGAM2921) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40823] VGAM2921 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2921 was detected is described hereinabove with reference to Figs. 2-8.

[40824] VGAM2921 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 2. VGAM2921 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40825] VGAM2921 gene, herein designated VGAM GENE, encodes a VGAM2921 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2921 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2921 precursor RNA is designated SEQ ID:1980, and is provided hereinbelow with reference to the sequence listing part.

[40826] VGAM2921 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40827] An enzyme complex designated DICER COMPLEX, dices the VGAM2921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2921 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2921 RNA is designated SEQ ID:5050, and is provided hereinbelow with reference to the sequence listing part.

[40828] VGAM2921 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40829] VGAM2921 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2921 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2921 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40830] The complementary binding of VGAM2921 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2921 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2921 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40831] It is appreciated that VGAM2921 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2921 host target genes. The mRNA of each one of this plurality of VGAM2921 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2921 RNA, herein designated VGAM RNA, and which when bound by VGAM2921 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2921 host target proteins.

[40832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2921 gene, herein designated VGAM GENE, on one or more VGAM2921 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40833] It is yet further appreciated that a function of VGAM2921 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2921 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 2. Specific functions, and accordingly utilities, of VGAM2921 correlate with, and may be deduced from, the identity of the host target genes which VGAM2921 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40834] Nucleotide sequences of the VGAM2921 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2921 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2921 are further described hereinbelow with reference to Table 1.

[40835] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2921 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40836] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2922 (VGAM2922) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40837] VGAM2922 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2922 was detected is described hereinabove with reference to Figs. 2-8.

[40838] VGAM2922 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM2922 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40839] VGAM2922 gene, herein designated VGAM GENE, encodes a VGAM2922 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2922 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2922 precursor RNA is designated SEQ ID:2632, and is provided hereinbelow with reference to the sequence listing part.

[40840] VGAM2922 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40841] An enzyme complex designated DICER COMPLEX, dices the VGAM2922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2922 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2922 RNA is designated SEQ ID:5702, and is provided hereinbelow with reference to the sequence listing part.

[40842] VGAM2922 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40843] VGAM2922 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2922 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2922 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40844] The complementary binding of VGAM2922 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2922 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2922 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40845] It is appreciated that VGAM2922 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2922 host target genes. The mRNA of

each one of this plurality of VGAM2922 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2922 RNA, herein designated VGAM RNA, and which when bound by VGAM2922 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2922 host target proteins.

[40846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2922 gene, herein designated VGAM GENE, on one or more VGAM2922 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[40847] It is yet further appreciated that a function of VGAM2922 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2922 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2922 correlate with, and may be deduced from, the identity of the host target genes which VGAM2922 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40848] Nucleotide sequences of the VGAM2922 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2922 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2922 are further described hereinbelow with reference to Table 1.

[40849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2922 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[40850] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2923 (VGAM2923) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40851] VGAM2923 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2923 was detected is described hereinabove with reference to Figs. 2-8.

[40852] VGAM2923 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline herpesvirus 3. VGAM2923 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40853] VGAM2923 gene, herein designated VGAM GENE, encodes a VGAM2923 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2923 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2923 precursor RNA is designated SEQ ID:2627, and is provided hereinbelow with reference to the sequence listing part.

[40854] VGAM2923 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40855] An enzyme complex designated DICER COMPLEX, dices the VGAM2923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2923 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2923 RNA is designated SEQ ID:5697, and

is provided hereinbelow with reference to the sequence listing part.

[40856] VGAM2923 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40857] VGAM2923 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2923 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2923 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40858] The complementary binding of VGAM2923 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2923 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2923 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40859] It is appreciated that VGAM2923 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2923 host target genes. The mRNA of each one of this plurality of VGAM2923 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2923 RNA, herein designated VGAM RNA, and which when bound by VGAM2923 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2923 host target proteins.

[40860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2923 gene, herein designated VGAM GENE, on one or more VGAM2923 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40861] It is yet further appreciated that a function of VGAM2923 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2923 include diagnosis, prevention and treatment of viral infection by Ateline herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2923 correlate with, and may be deduced from, the identity of the host target genes which VGAM2923 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40862] Nucleotide sequences of the VGAM2923 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2923 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2923 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2923 are further described hereinbelow with reference to Table 1.

[40863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2923 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40864] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2924 (VGAM2924) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40865] VGAM2924 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2924 was detected is described hereinabove with reference to Figs. 2-8.

[40866] VGAM2924 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2924 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40867] VGAM2924 gene, herein designated VGAM GENE, encodes a VGAM2924 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2924 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2924 precur-

sor RNA is designated SEQ ID:2628, and is provided hereinbelow with reference to the sequence listing part.

[40868] VGAM2924 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40869] An enzyme complex designated DICER COMPLEX, dices the VGAM2924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2924 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2924 RNA is designated SEQ ID:5698, and is provided hereinbelow with reference to the sequence

listing part.

[40870] VGAM2924 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40871] VGAM2924 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2924 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2924 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40872] The complementary binding of VGAM2924 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2924 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2924 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40873] It is appreciated that VGAM2924 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2924 host target genes. The mRNA of each one of this plurality of VGAM2924 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2924 RNA, herein designated VGAM RNA, and which when bound by VGAM2924 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2924 host target proteins.

[40874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2924 gene, herein designated VGAM GENE, on one or more VGAM2924 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40875] It is yet further appreciated that a function of VGAM2924

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2924 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2924 correlate with, and may be deduced from, the identity of the host target genes which VGAM2924 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40876] Nucleotide sequences of the VGAM2924 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2924 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2924 are further described hereinbelow with reference to Table 1.

[40877] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2924 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40878] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2925 (VGAM2925) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40879] VGAM2925 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2925 was detected is described hereinabove with reference to Figs. 2-8.

[40880] VGAM2925 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2925 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40881] VGAM2925 gene, herein designated VGAM GENE, encodes a VGAM2925 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2925 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2925 precursor RNA is designated SEQ ID:2629, and is provided here-

inbelow with reference to the sequence listing part.

[40882] VGAM2925 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40883] An enzyme complex designated DICER COMPLEX, dices the VGAM2925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2925 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2925 RNA is designated SEQ ID:5699, and is provided hereinbelow with reference to the sequence listing part.

[40884] VGAM2925 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40885] VGAM2925 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2925 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2925 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40886] The complementary binding of VGAM2925 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2925 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2925 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40887] It is appreciated that VGAM2925 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2925 host target genes. The mRNA of each one of this plurality of VGAM2925 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2925 RNA, herein designated VGAM RNA, and which when bound by VGAM2925 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2925 host target proteins.

[40888] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2925 gene, herein designated VGAM GENE, on one or more VGAM2925 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40889] It is yet further appreciated that a function of VGAM2925 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2925 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2925 correlate with, and may be deduced from, the identity of the host target genes which VGAM2925 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40890] Nucleotide sequences of the VGAM2925 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2925 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2925 are further described hereinbelow with reference to Table 1.

[40891] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2925 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40892] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2926 (VGAM2926) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40893] VGAM2926 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2926 was detected is described hereinabove with reference to Figs. 2-8.

[40894] VGAM2926 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2926 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40895] VGAM2926 gene, herein designated VGAM GENE, encodes a VGAM2926 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2926 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2926 precursor RNA is designated SEQ ID:2630, and is provided hereinbelow with reference to the sequence listing part.

[40896] VGAM2926 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40897] An enzyme complex designated DICER COMPLEX, dices the VGAM2926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2926 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2926 RNA is designated SEQ ID:5700, and is provided hereinbelow with reference to the sequence listing part.

[40898] VGAM2926 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40899] VGAM2926 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2926 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2926 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40900] The complementary binding of VGAM2926 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2926 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2926 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40901] It is appreciated that VGAM2926 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2926 host target genes. The mRNA of each one of this plurality of VGAM2926 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2926 RNA, herein designated VGAM

RNA, and which when bound by VGAM2926 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2926 host target proteins.

[40902] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2926 gene, herein designated VGAM GENE, on one or more VGAM2926 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40903] It is yet further appreciated that a function of VGAM2926 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2926 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2926 correlate with, and may be deduced from, the identity of the host target genes which VGAM2926 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40904] Nucleotide sequences of the VGAM2926 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2926 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2926 are further described hereinbelow with reference to Table 1.

[40905] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2926 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40906] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2927 (VGAM2927) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40907] VGAM2927 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2927 was detected is described hereinabove with reference to Figs. 2-8.

[40908] VGAM2927 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM2927 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40909] VGAM2927 gene, herein designated VGAM GENE, encodes a VGAM2927 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2927 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2927 precursor RNA is designated SEQ ID:2633, and is provided hereinbelow with reference to the sequence listing part.

[40910] VGAM2927 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40911] An enzyme complex designated DICER COMPLEX, dices the VGAM2927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2927 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2927 RNA is designated SEQ ID:5703, and is provided hereinbelow with reference to the sequence listing part.

[40912] VGAM2927 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2927 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2927 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40913] VGAM2927 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2927 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2927 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2927 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2927 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40914] The complementary binding of VGAM2927 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2927 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2927 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2927 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40915] It is appreciated that VGAM2927 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2927 host target genes. The mRNA of each one of this plurality of VGAM2927 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2927 RNA, herein designated VGAM RNA, and which when bound by VGAM2927 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2927 host target proteins.

[40916] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2927 gene, herein designated VGAM GENE, on one or more VGAM2927 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40917] It is yet further appreciated that a function of VGAM2927 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2927 include diagnosis, prevention and

treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2927 correlate with, and may be deduced from, the identity of the host target genes which VGAM2927 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40918] Nucleotide sequences of the VGAM2927 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2927 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2927 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2927 are further described hereinbelow with reference to Table 1.

[40919] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2927 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40920] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2928 (VGAM2928) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40921] VGAM2928 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2928 was detected is described hereinabove with reference to Figs. 2-8.

[40922] VGAM2928 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM2928 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40923] VGAM2928 gene, herein designated VGAM GENE, encodes a VGAM2928 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2928 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2928 precursor RNA is designated SEQ ID:2634, and is provided hereinbelow with reference to the sequence listing part.

[40924] VGAM2928 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2928 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40925] An enzyme complex designated DICER COMPLEX, dices the VGAM2928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2928 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2928 RNA is designated SEQ ID:5704, and is provided hereinbelow with reference to the sequence listing part.

[40926] VGAM2928 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2928 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2928 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40927] VGAM2928 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2928 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2928 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2928 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2928 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40928] The complementary binding of VGAM2928 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2928 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2928 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2928 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40929] It is appreciated that VGAM2928 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2928 host target genes. The mRNA of each one of this plurality of VGAM2928 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2928 RNA, herein designated VGAM RNA, and which when bound by VGAM2928 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2928 host target proteins.

[40930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2928 gene, herein designated VGAM GENE, on one or more VGAM2928 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40931] It is yet further appreciated that a function of VGAM2928 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2928 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Spe-

cific functions, and accordingly utilities, of VGAM2928 correlate with, and may be deduced from, the identity of the host target genes which VGAM2928 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40932] Nucleotide sequences of the VGAM2928 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2928 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2928 are further described hereinbelow with reference to Table 1.

[40933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2928 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40934] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2929 (VGAM2929) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[40935] VGAM2929 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2929 was detected is described hereinabove with reference to Figs. 2-8.

[40936] VGAM2929 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P virus. VGAM2929 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40937] VGAM2929 gene, herein designated VGAM GENE, encodes a VGAM2929 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2929 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2929 precursor RNA is designated SEQ ID:2631, and is provided hereinbelow with reference to the sequence listing part.

[40938] VGAM2929 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2929 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40939] An enzyme complex designated DICER COMPLEX, dices the VGAM2929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2929 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2929 RNA is designated SEQ ID:5701, and is provided hereinbelow with reference to the sequence listing part.

[40940] VGAM2929 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2929 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2929 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40941] VGAM2929 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2929 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2929 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2929 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2929 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40942] The complementary binding of VGAM2929 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2929 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2929 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2929 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40943] It is appreciated that VGAM2929 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2929 host target genes. The mRNA of each one of this plurality of VGAM2929 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2929 RNA, herein designated VGAM RNA, and which when bound by VGAM2929 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2929 host target proteins.

[40944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2929 gene, herein designated VGAM GENE, on one or more VGAM2929 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40945] It is yet further appreciated that a function of VGAM2929 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2929 include diagnosis, prevention and treatment of viral infection by Himetobi P virus. Specific functions, and accordingly utilities, of VGAM2929 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2929 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40946] Nucleotide sequences of the VGAM2929 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2929 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2929 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2929 are further described hereinbelow with reference to Table 1.

[40947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2929 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40948] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2930 (VGAM2930) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[40949] VGAM2930 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2930 was detected is described hereinabove with reference to Figs. 2-8.

[40950] VGAM2930 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM2930 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40951] VGAM2930 gene, herein designated VGAM GENE, encodes a VGAM2930 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2930 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2930 precursor RNA is designated SEQ ID:2635, and is provided hereinbelow with reference to the sequence listing part.

[40952] VGAM2930 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40953] An enzyme complex designated DICER COMPLEX, dices the VGAM2930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2930 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2930 RNA is designated SEQ ID:5705, and is provided hereinbelow with reference to the sequence listing part.

[40954] VGAM2930 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40955] VGAM2930 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2930 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2930 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40956] The complementary binding of VGAM2930 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2930 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2930 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40957] It is appreciated that VGAM2930 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2930 host target genes. The mRNA of each one of this plurality of VGAM2930 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2930 RNA, herein designated VGAM RNA, and which when bound by VGAM2930 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2930 host target proteins.

[40958] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2930 gene, herein designated VGAM GENE, on one or more VGAM2930 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40959] It is yet further appreciated that a function of VGAM2930 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2930 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM2930 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2930 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40960] Nucleotide sequences of the VGAM2930 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2930 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2930 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2930 are further described hereinbelow with reference to Table 1.

[40961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2930 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40962] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2931 (VGAM2931) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40963] VGAM2931 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2931 was detected is described hereinabove with reference to Figs. 2-8.

[40964] VGAM2931 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox virus. VGAM2931 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40965] VGAM2931 gene, herein designated VGAM GENE, encodes a VGAM2931 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2931 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2931 precursor RNA is designated SEQ ID:2638, and is provided hereinbelow with reference to the sequence listing part.

[40966] VGAM2931 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40967] An enzyme complex designated DICER COMPLEX, dices the VGAM2931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2931 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2931 RNA is designated SEQ ID:5708, and is provided hereinbelow with reference to the sequence listing part.

[40968] VGAM2931 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40969] VGAM2931 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2931 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2931 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40970] The complementary binding of VGAM2931 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2931 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2931 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40971] It is appreciated that VGAM2931 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2931 host target genes. The mRNA of each one of this plurality of VGAM2931 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2931 RNA, herein designated VGAM RNA, and which when bound by VGAM2931 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2931 host target proteins.

[40972] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2931 gene, herein designated VGAM GENE, on one or more VGAM2931 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40973] It is yet further appreciated that a function of VGAM2931 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2931 include diagnosis, prevention and treatment of viral infection by Monkeypox virus. Specific functions, and accordingly utilities, of VGAM2931 correlate with, and may be deduced from, the identity of the host target genes which VGAM2931 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[40974] Nucleotide sequences of the VGAM2931 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2931 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2931 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2931 are further described hereinbelow with reference to Table 1.

[40975] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2931 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40976] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2932 (VGAM2932) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40977] VGAM2932 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2932 was detected is described hereinabove with reference to Figs. 2-8.

[40978] VGAM2932 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2932 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40979] VGAM2932 gene, herein designated VGAM GENE, encodes a VGAM2932 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2932 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2932 precursor RNA is designated SEQ ID:2636, and is provided hereinbelow with reference to the sequence listing part.

[40980] VGAM2932 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40981] An enzyme complex designated DICER COMPLEX, dices the VGAM2932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2932 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2932 RNA is designated SEQ ID:5706, and is provided hereinbelow with reference to the sequence listing part.

[40982] VGAM2932 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[40983] VGAM2932 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2932 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2932 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40984] The complementary binding of VGAM2932 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2932 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2932 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40985] It is appreciated that VGAM2932 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2932 host target genes. The mRNA of each one of this plurality of VGAM2932 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2932 RNA, herein designated VGAM RNA, and which when bound by VGAM2932 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2932 host target proteins.

[40986] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2932 gene, herein designated VGAM GENE, on one

or more VGAM2932 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[40987] It is yet further appreciated that a function of VGAM2932 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2932 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2932 correlate with, and may be deduced from, the identity of the host target genes which VGAM2932 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[40988] Nucleotide sequences of the VGAM2932 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2932 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2932 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2932 are further described hereinbelow with reference to Table 1.

[40989] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2932 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[40990] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2933 (VGAM2933) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[40991] VGAM2933 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2933 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[40992] VGAM2933 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2933 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[40993] VGAM2933 gene, herein designated VGAM GENE, encodes a VGAM2933 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2933 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2933 precursor RNA is designated SEQ ID:2639, and is provided hereinbelow with reference to the sequence listing part.

[40994] VGAM2933 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[40995] An enzyme complex designated DICER COMPLEX, dices the VGAM2933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2933 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2933 RNA is designated SEQ ID:5709, and is provided hereinbelow with reference to the sequence listing part.

[40996] VGAM2933 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[40997] VGAM2933 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2933 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2933 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[40998] The complementary binding of VGAM2933 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2933 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2933 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[40999] It is appreciated that VGAM2933 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2933 host target genes. The mRNA of each one of this plurality of VGAM2933 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2933 RNA, herein designated VGAM RNA, and which when bound by VGAM2933 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2933 host target proteins.

[41000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2933 gene, herein designated VGAM GENE, on one or more VGAM2933 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41001] It is yet further appreciated that a function of VGAM2933 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2933 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2933 correlate with, and may be deduced from, the identity of the host target genes which VGAM2933 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41002] Nucleotide sequences of the VGAM2933 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2933 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2933 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2933 are further described hereinbelow with reference to Table 1.

[41003] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2933 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41004] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2934 (VGAM2934) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41005] VGAM2934 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2934 was detected is described hereinabove with reference to Figs. 2-8.

[41006] VGAM2934 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM2934 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41007] VGAM2934 gene, herein designated VGAM GENE, encodes a VGAM2934 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2934 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2934 precursor RNA is designated SEQ ID:2637, and is provided hereinbelow with reference to the sequence listing part.

[41008] VGAM2934 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[41009] An enzyme complex designated DICER COMPLEX, dices the VGAM2934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2934 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2934 RNA is designated SEQ ID:5707, and is provided hereinbelow with reference to the sequence listing part.

[41010] VGAM2934 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41011] VGAM2934 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2934 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2934 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41012] The complementary binding of VGAM2934 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2934 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2934 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41013] It is appreciated that VGAM2934 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2934 host target genes. The mRNA of each one of this plurality of VGAM2934 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2934 RNA, herein designated VGAM RNA, and which when bound by VGAM2934 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2934 host target proteins.

[41014] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2934 gene, herein designated VGAM GENE, on one or more VGAM2934 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41015] It is yet further appreciated that a function of VGAM2934 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2934 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2934 correlate with, and may be deduced from, the identity of the host target genes which VGAM2934 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41016] Nucleotide sequences of the VGAM2934 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2934 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2934 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2934 are further described hereinbelow with reference to Table 1.

[41017] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2934 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41018] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2935 (VGAM2935) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41019] VGAM2935 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2935 was detected is described hereinabove with reference to Figs. 2-8.

[41020] VGAM2935 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cowpea mottle virus. VGAM2935 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41021] VGAM2935 gene, herein designated VGAM GENE, encodes a VGAM2935 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2935 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2935 precursor RNA is designated SEQ ID:2640, and is provided hereinbelow with reference to the sequence listing part.

[41022] VGAM2935 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41023] An enzyme complex designated DICER COMPLEX, dices the VGAM2935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2935 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2935 RNA is designated SEQ ID:5710, and is provided hereinbelow with reference to the sequence listing part.

[41024] VGAM2935 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2935 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2935 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41025] VGAM2935 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2935 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2935 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2935 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2935 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41026] The complementary binding of VGAM2935 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2935 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2935 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2935 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41027] It is appreciated that VGAM2935 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2935 host target genes. The mRNA of each one of this plurality of VGAM2935 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2935 RNA, herein designated VGAM RNA, and which when bound by VGAM2935 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2935 host target proteins.

[41028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2935 gene, herein designated VGAM GENE, on one or more VGAM2935 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41029] It is yet further appreciated that a function of VGAM2935 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2935 include diagnosis, prevention and treatment of viral infection by Cowpea mottle virus. Specific functions, and accordingly utilities, of VGAM2935 correlate with, and may be deduced from, the identity of the host target genes which VGAM2935 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41030] Nucleotide sequences of the VGAM2935 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2935 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2935 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2935 are further described hereinbelow with reference to Table 1.

[41031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2935 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41032] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2936 (VGAM2936) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41033] VGAM2936 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2936 was detected is described hereinabove with reference to Figs. 2-8.

[41034] VGAM2936 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever

virus. VGAM2936 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41035] VGAM2936 gene, herein designated VGAM GENE, encodes a VGAM2936 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2936 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2936 precursor RNA is designated SEQ ID:2641, and is provided hereinbelow with reference to the sequence listing part.

[41036] VGAM2936 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41037] An enzyme complex designated DICER COMPLEX, dices

the VGAM2936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2936 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2936 RNA is designated SEQ ID:5711, and is provided hereinbelow with reference to the sequence listing part.

[41038] VGAM2936 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2936 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2936 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41039] VGAM2936 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2936 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2936 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2936 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2936 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41040] The complementary binding of VGAM2936 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2936 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2936 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2936 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41041] It is appreciated that VGAM2936 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2936 host target genes. The mRNA of each one of this plurality of VGAM2936 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2936 RNA, herein designated VGAM RNA, and which when bound by VGAM2936 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2936 host target proteins.

[41042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2936 gene, herein designated VGAM GENE, on one or more VGAM2936 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41043] It is yet further appreciated that a function of VGAM2936 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2936 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2936 correlate with, and may be deduced from, the identity of the host target genes which VGAM2936 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41044] Nucleotide sequences of the VGAM2936 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2936 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2936 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2936 are further described hereinbelow with reference to Table 1.

[41045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2936 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41046] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2937 (VGAM2937) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41047] VGAM2937 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2937 was detected is described hereinabove with reference to Figs. 2-8.

[41048] VGAM2937 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2937 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[41049] VGAM2937 gene, herein designated VGAM GENE, encodes a VGAM2937 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2937 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2937 precursor RNA is designated SEQ ID:2642, and is provided hereinbelow with reference to the sequence listing part.

[41050] VGAM2937 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2937 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41051] An enzyme complex designated DICER COMPLEX, dices the VGAM2937 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2937 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2937 RNA is designated SEQ ID:5712, and is provided hereinbelow with reference to the sequence listing part.

[41052] VGAM2937 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2937 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2937 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41053] VGAM2937 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2937 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2937 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2937 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2937 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41054] The complementary binding of VGAM2937 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2937 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2937

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2937 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41055] It is appreciated that VGAM2937 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2937 host target genes. The mRNA of each one of this plurality of VGAM2937 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2937 RNA, herein designated VGAM RNA, and which when bound by VGAM2937 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2937 host target proteins.

[41056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2937 gene, herein designated VGAM GENE, on one or more VGAM2937 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41057] It is yet further appreciated that a function of VGAM2937 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2937 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2937 correlate with, and may be deduced from, the identity of the host target genes which VGAM2937 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41058] Nucleotide sequences of the VGAM2937 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2937 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2937 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2937 are further described hereinbelow with reference to Table 1.

[41059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2937 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41060] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2938 (VGAM2938) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41061] VGAM2938 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2938 was detected is described hereinabove with reference to Figs. 2-8.

[41062] VGAM2938 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Patchouli mild mosaic virus. VGAM2938 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[41063] VGAM2938 gene, herein designated VGAM GENE, encodes a VGAM2938 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2938 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2938 precursor RNA is designated SEQ ID:2643, and is provided hereinbelow with reference to the sequence listing part.

[41064] VGAM2938 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41065] An enzyme complex designated DICER COMPLEX, dices the VGAM2938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2938 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2938 RNA is designated SEQ ID:5713, and is provided hereinbelow with reference to the sequence listing part.

[41066] VGAM2938 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2938 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2938 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41067] VGAM2938 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2938 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2938 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2938 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2938 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41068] The complementary binding of VGAM2938 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2938 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2938 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2938 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41069] It is appreciated that VGAM2938 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2938 host target genes. The mRNA of each one of this plurality of VGAM2938 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2938 RNA, herein designated VGAM RNA, and which when bound by VGAM2938 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2938 host target proteins.

[41070] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2938 gene, herein designated VGAM GENE, on one or more VGAM2938 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41071] It is yet further appreciated that a function of VGAM2938 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2938 include diagnosis, prevention and treatment of viral infection by Patchouli mild mosaic virus. Specific functions, and accordingly utilities, of VGAM2938 correlate with, and may be deduced from, the identity of the host target genes which VGAM2938 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41072] Nucleotide sequences of the VGAM2938 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2938 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2938 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2938 are further

described hereinbelow with reference to Table 1.

[41073] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2938 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41074] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2939 (VGAM2939) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41075] VGAM2939 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2939 was detected is described hereinabove with reference to Figs. 2-8.

[41076] VGAM2939 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2939 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41077] VGAM2939 gene, herein designated VGAM GENE, encodes a VGAM2939 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2939 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2939 precursor RNA is designated SEQ ID:2646, and is provided hereinbelow with reference to the sequence listing part.

[41078] VGAM2939 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41079] An enzyme complex designated DICER COMPLEX, dices the VGAM2939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2939 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2939 RNA is designated SEQ ID:5716, and is provided hereinbelow with reference to the sequence listing part.

[41080] VGAM2939 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41081] VGAM2939 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2939 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2939 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41082] The complementary binding of VGAM2939 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2939 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2939 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41083] It is appreciated that VGAM2939 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2939 host target genes. The mRNA of each one of this plurality of VGAM2939 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2939 RNA, herein designated VGAM RNA, and which when bound by VGAM2939 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2939 host target proteins.

[41084] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2939 gene, herein designated VGAM GENE, on one or more VGAM2939 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41085] It is yet further appreciated that a function of VGAM2939 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2939 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2939 correlate with, and may be deduced from, the identity of the host target genes which VGAM2939 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41086] Nucleotide sequences of the VGAM2939 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2939 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2939 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2939 are further described hereinbelow with reference to Table 1.

[41087] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2939 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41088] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2940 (VGAM2940) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41089] VGAM2940 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2940 was detected is described hereinabove with reference to Figs. 2-8.

[41090] VGAM2940 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Molluscum contagiosum virus. VGAM2940 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41091] VGAM2940 gene, herein designated VGAM GENE, encodes

a VGAM2940 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2940 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2940 precursor RNA is designated SEQ ID:2644, and is provided hereinbelow with reference to the sequence listing part.

[41092] VGAM2940 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41093] An enzyme complex designated DICER COMPLEX, dices the VGAM2940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2940 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2940 RNA is designated SEQ ID:5714, and is provided hereinbelow with reference to the sequence listing part.

[41094] VGAM2940 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41095] VGAM2940 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2940 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2940 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41096] The complementary binding of VGAM2940 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2940 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2940 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[41097] It is appreciated that VGAM2940 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2940 host target genes. The mRNA of each one of this plurality of VGAM2940 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2940 RNA, herein designated VGAM RNA, and which when bound by VGAM2940 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2940 host target proteins.

[41098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2940 gene, herein designated VGAM GENE, on one or more VGAM2940 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41099] It is yet further appreciated that a function of VGAM2940 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2940 include diagnosis, prevention and treatment of viral infection by Molluscum contagiosum virus. Specific functions, and accordingly utilities, of VGAM2940 correlate with, and may be deduced from, the identity of the host target genes which VGAM2940 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41100] Nucleotide sequences of the VGAM2940 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2940 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2940 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2940 are further described hereinbelow with reference to Table 1.

[41101] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2940 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41102] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2941 (VGAM2941) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41103] VGAM2941 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2941 was detected is described hereinabove with reference to Figs. 2-8.

[41104] VGAM2941 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2941 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41105] VGAM2941 gene, herein designated VGAM GENE, encodes a VGAM2941 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2941 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2941 precursor RNA is designated SEQ ID:2645, and is provided hereinbelow with reference to the sequence listing part.

[41106] VGAM2941 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41107] An enzyme complex designated DICER COMPLEX, dices the VGAM2941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2941 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2941 RNA is designated SEQ ID:5715, and is provided hereinbelow with reference to the sequence listing part.

[41108] VGAM2941 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41109] VGAM2941 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2941 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2941 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41110] The complementary binding of VGAM2941 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2941 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2941 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41111] It is appreciated that VGAM2941 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2941 host target genes. The mRNA of each one of this plurality of VGAM2941 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2941 RNA, herein designated VGAM RNA, and which when bound by VGAM2941 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2941 host target proteins.

[41112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2941 gene, herein designated VGAM GENE, on one or more VGAM2941 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41113] It is yet further appreciated that a function of VGAM2941 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2941 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2941 correlate with, and may be deduced from, the identity of the host target genes which VGAM2941 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41114] Nucleotide sequences of the VGAM2941 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2941 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2941 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2941 are further described hereinbelow with reference to Table 1.

[41115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2941 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41116] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2942 (VGAM2942) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41117] VGAM2942 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2942 was detected is described hereinabove with reference to Figs. 2-8.

[41118] VGAM2942 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2942 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41119] VGAM2942 gene, herein designated VGAM GENE, encodes a VGAM2942 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2942 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2942 precursor RNA is designated SEQ ID:2647, and is provided hereinbelow with reference to the sequence listing part.

[41120] VGAM2942 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41121] An enzyme complex designated DICER COMPLEX, dices the VGAM2942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2942 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2942 RNA is designated SEQ ID:5717, and is provided hereinbelow with reference to the sequence listing part.

[41122] VGAM2942 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41123] VGAM2942 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2942 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2942 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41124] The complementary binding of VGAM2942 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2942 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2942 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41125] It is appreciated that VGAM2942 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2942 host target genes. The mRNA of each one of this plurality of VGAM2942 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2942 RNA, herein designated VGAM RNA, and which when bound by VGAM2942 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2942 host target proteins.

[41126] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2942 gene, herein designated VGAM GENE, on one or more VGAM2942 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41127] It is yet further appreciated that a function of VGAM2942 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2942 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2942 correlate with, and may be deduced from, the identity of the host target genes which VGAM2942 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41128] Nucleotide sequences of the VGAM2942 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2942 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2942 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2942 are further described hereinbelow with reference to Table 1.

[41129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2942 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41130] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2943 (VGAM2943) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41131] VGAM2943 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2943 was detected is described hereinabove with reference to Figs. 2-8.

[41132] VGAM2943 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1. VGAM2943 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41133] VGAM2943 gene, herein designated VGAM GENE, encodes a VGAM2943 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2943 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2943 precursor RNA is designated SEQ ID:2654, and is provided hereinbelow with reference to the sequence listing part.

[41134] VGAM2943 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41135] An enzyme complex designated DICER COMPLEX, dices the VGAM2943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2943 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2943 RNA is designated SEQ ID:5724, and is provided hereinbelow with reference to the sequence listing part.

[41136] VGAM2943 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41137] VGAM2943 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2943 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2943 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41138] The complementary binding of VGAM2943 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2943 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2943 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41139] It is appreciated that VGAM2943 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2943 host target genes. The mRNA of each one of this plurality of VGAM2943 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2943 RNA, herein designated VGAM RNA, and which when bound by VGAM2943 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2943 host target proteins.

[41140] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2943 gene, herein designated VGAM GENE, on one or more VGAM2943 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41141] It is yet further appreciated that a function of VGAM2943 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2943 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM2943 correlate with, and may be deduced from, the identity of the host target genes which VGAM2943 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41142] Nucleotide sequences of the VGAM2943 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2943 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2943 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2943 are further described hereinbelow with reference to Table 1.

[41143] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2943 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41144] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2944 (VGAM2944) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41145] VGAM2944 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2944 was detected is described hereinabove with reference to Figs. 2-8.

[41146] VGAM2944 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus yellow net virus. VGAM2944 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41147] VGAM2944 gene, herein designated VGAM GENE, encodes a VGAM2944 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2944 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2944 precursor RNA is designated SEQ ID:2648, and is provided hereinbelow with reference to the sequence listing part.

[41148] VGAM2944 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41149] An enzyme complex designated DICER COMPLEX, dices the VGAM2944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2944 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide se-

quence of VGAM2944 RNA is designated SEQ ID:5718, and is provided hereinbelow with reference to the sequence listing part.

[41150] VGAM2944 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41151] VGAM2944 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2944 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2944 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41152] The complementary binding of VGAM2944 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2944 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2944 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41153] It is appreciated that VGAM2944 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2944 host target genes. The mRNA of

each one of this plurality of VGAM2944 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2944 RNA, herein designated VGAM RNA, and which when bound by VGAM2944 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2944 host target proteins.

[41154] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2944 gene, herein designated VGAM GENE, on one or more VGAM2944 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[41155] It is yet further appreciated that a function of VGAM2944 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2944 include diagnosis, prevention and treatment of viral infection by Sonchus yellow net virus. Specific functions, and accordingly utilities, of VGAM2944 correlate with, and may be deduced from, the identity of the host target genes which VGAM2944 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41156] Nucleotide sequences of the VGAM2944 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2944 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2944 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2944 are further described hereinbelow with reference to Table 1.

[41157] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2944 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[41158] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2945 (VGAM2945) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41159] VGAM2945 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2945 was detected is described hereinabove with reference to Figs. 2-8.

[41160] VGAM2945 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine reproductive and respiratory syndrome virus. VGAM2945 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41161] VGAM2945 gene, herein designated VGAM GENE, encodes a VGAM2945 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2945 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2945 precursor RNA is designated SEQ ID:2649, and is provided hereinbelow with reference to the sequence listing part.

[41162] VGAM2945 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41163] An enzyme complex designated DICER COMPLEX, dices the VGAM2945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2945 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2945 RNA is designated SEQ ID:5719, and

is provided hereinbelow with reference to the sequence listing part.

[41164] VGAM2945 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41165] VGAM2945 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2945 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2945 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41166] The complementary binding of VGAM2945 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2945 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2945 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41167] It is appreciated that VGAM2945 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2945 host target genes. The mRNA of each one of this plurality of VGAM2945 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2945 RNA, herein designated VGAM RNA, and which when bound by VGAM2945 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2945 host target proteins.

[41168] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2945 gene, herein designated VGAM GENE, on one or more VGAM2945 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41169] It is yet further appreciated that a function of VGAM2945 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2945 include diagnosis, prevention and treatment of viral infection by Porcine reproductive and respiratory syndrome virus. Specific functions, and accordingly utilities, of VGAM2945 correlate with, and may be deduced from, the identity of the host target genes which VGAM2945 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41170] Nucleotide sequences of the VGAM2945 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2945 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2945 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2945 are further described hereinbelow with reference to Table 1.

[41171] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2945 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41172] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2946 (VGAM2946) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41173] VGAM2946 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2946 was detected is described hereinabove with reference to Figs. 2-8.

[41174] VGAM2946 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine reproductive and respiratory syndrome virus. VGAM2946 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41175] VGAM2946 gene, herein designated VGAM GENE, encodes a VGAM2946 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2946 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2946 precur-

sor RNA is designated SEQ ID:2655, and is provided hereinbelow with reference to the sequence listing part.

[41176] VGAM2946 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41177] An enzyme complex designated DICER COMPLEX, dices the VGAM2946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2946 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2946 RNA is designated SEQ ID:5725, and is provided hereinbelow with reference to the sequence

listing part.

[41178] VGAM2946 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41179] VGAM2946 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2946 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2946 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41180] The complementary binding of VGAM2946 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2946 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2946 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41181] It is appreciated that VGAM2946 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2946 host target genes. The mRNA of each one of this plurality of VGAM2946 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2946 RNA, herein designated VGAM RNA, and which when bound by VGAM2946 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2946 host target proteins.

[41182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2946 gene, herein designated VGAM GENE, on one or more VGAM2946 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41183] It is yet further appreciated that a function of VGAM2946

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2946 include diagnosis, prevention and treatment of viral infection by Porcine reproductive and respiratory syndrome virus. Specific functions, and accordingly utilities, of VGAM2946 correlate with, and may be deduced from, the identity of the host target genes which VGAM2946 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41184] Nucleotide sequences of the VGAM2946 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2946 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2946 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2946 are further described hereinbelow with reference to Table 1.

[41185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2946 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41186] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2947 (VGAM2947) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41187] VGAM2947 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2947 was detected is described hereinabove with reference to Figs. 2-8.

[41188] VGAM2947 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM2947 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41189] VGAM2947 gene, herein designated VGAM GENE, encodes a VGAM2947 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2947 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2947 precursor RNA is designated SEQ ID:2650, and is provided here-

inbelow with reference to the sequence listing part.

[41190] VGAM2947 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41191] An enzyme complex designated DICER COMPLEX, dices the VGAM2947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2947 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2947 RNA is designated SEQ ID:5720, and is provided hereinbelow with reference to the sequence listing part.

[41192] VGAM2947 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41193] VGAM2947 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2947 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2947 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41194] The complementary binding of VGAM2947 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2947 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2947 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41195] It is appreciated that VGAM2947 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2947 host target genes. The mRNA of each one of this plurality of VGAM2947 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM2947 RNA, herein designated VGAM RNA, and which when bound by VGAM2947 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2947 host target proteins.

[41196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2947 gene, herein designated VGAM GENE, on one or more VGAM2947 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41197] It is yet further appreciated that a function of VGAM2947 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2947 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2947 correlate with, and may be deduced from, the identity of the host target genes which VGAM2947 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41198] Nucleotide sequences of the VGAM2947 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2947 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2947 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2947 are further described hereinbelow with reference to Table 1.

[41199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2947 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41200] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 2948 (VGAM2948) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41201] VGAM2948 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2948 was detected is described hereinabove with reference to Figs. 2-8.

[41202] VGAM2948 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM2948 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41203] VGAM2948 gene, herein designated VGAM GENE, encodes a VGAM2948 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2948 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2948 precursor RNA is designated SEQ ID:2651, and is provided hereinbelow with reference to the sequence listing part.

[41204] VGAM2948 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41205] An enzyme complex designated DICER COMPLEX, dices the VGAM2948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2948 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2948 RNA is designated SEQ ID:5721, and is provided hereinbelow with reference to the sequence listing part.

[41206] VGAM2948 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41207] VGAM2948 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2948 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2948 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41208] The complementary binding of VGAM2948 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2948 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2948 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41209] It is appreciated that VGAM2948 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2948 host target genes. The mRNA of each one of this plurality of VGAM2948 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2948 RNA, herein designated VGAM

RNA, and which when bound by VGAM2948 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2948 host target proteins.

[41210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2948 gene, herein designated VGAM GENE, on one or more VGAM2948 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41211] It is yet further appreciated that a function of VGAM2948 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2948 include diagnosis, prevention and treatment of viral infection by Chimpanzee cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2948 correlate with, and may be deduced from, the identity of the host target genes which VGAM2948 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41212] Nucleotide sequences of the VGAM2948 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2948 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2948 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2948 are further described hereinbelow with reference to Table 1.

[41213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2948 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41214] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2949 (VGAM2949) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41215] VGAM2949 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2949 was detected is described hereinabove with reference to Figs. 2-8.

[41216] VGAM2949 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2949 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41217] VGAM2949 gene, herein designated VGAM GENE, encodes a VGAM2949 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2949 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2949 precursor RNA is designated SEQ ID:2652, and is provided hereinbelow with reference to the sequence listing part.

[41218] VGAM2949 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41219] An enzyme complex designated DICER COMPLEX, dices the VGAM2949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2949 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2949 RNA is designated SEQ ID:5722, and is provided hereinbelow with reference to the sequence listing part.

[41220] VGAM2949 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2949 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2949 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41221] VGAM2949 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2949 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2949 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2949 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2949 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41222] The complementary binding of VGAM2949 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2949 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2949 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2949 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41223] It is appreciated that VGAM2949 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2949 host target genes. The mRNA of each one of this plurality of VGAM2949 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2949 RNA, herein designated VGAM RNA, and which when bound by VGAM2949 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2949 host target proteins.

[41224] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2949 gene, herein designated VGAM GENE, on one or more VGAM2949 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41225] It is yet further appreciated that a function of VGAM2949 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2949 include diagnosis, prevention and

treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2949 correlate with, and may be deduced from, the identity of the host target genes which VGAM2949 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41226] Nucleotide sequences of the VGAM2949 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2949 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2949 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2949 are further described hereinbelow with reference to Table 1.

[41227] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2949 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41228] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2950 (VGAM2950) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41229] VGAM2950 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2950 was detected is described hereinabove with reference to Figs. 2-8.

[41230] VGAM2950 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human adenovirus C. VGAM2950 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41231] VGAM2950 gene, herein designated VGAM GENE, encodes a VGAM2950 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2950 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2950 precursor RNA is designated SEQ ID:2653, and is provided hereinbelow with reference to the sequence listing part.

[41232] VGAM2950 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2950 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41233] An enzyme complex designated DICER COMPLEX, dices the VGAM2950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2950 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2950 RNA is designated SEQ ID:5723, and is provided hereinbelow with reference to the sequence listing part.

[41234] VGAM2950 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2950 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2950 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41235] VGAM2950 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2950 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2950 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2950 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2950 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41236] The complementary binding of VGAM2950 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2950 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2950 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2950 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41237] It is appreciated that VGAM2950 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2950 host target genes. The mRNA of each one of this plurality of VGAM2950 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2950 RNA, herein designated VGAM RNA, and which when bound by VGAM2950 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2950 host target proteins.

[41238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2950 gene, herein designated VGAM GENE, on one or more VGAM2950 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41239] It is yet further appreciated that a function of VGAM2950 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2950 include diagnosis, prevention and treatment of viral infection by Human adenovirus C. Spe-

cific functions, and accordingly utilities, of VGAM2950 correlate with, and may be deduced from, the identity of the host target genes which VGAM2950 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41240] Nucleotide sequences of the VGAM2950 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2950 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2950 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2950 are further described hereinbelow with reference to Table 1.

[41241] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2950 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41242] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2951 (VGAM2951) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[41243] VGAM2951 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2951 was detected is described hereinabove with reference to Figs. 2-8.

[41244] VGAM2951 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM2951 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41245] VGAM2951 gene, herein designated VGAM GENE, encodes a VGAM2951 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2951 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2951 precursor RNA is designated SEQ ID:2656, and is provided hereinbelow with reference to the sequence listing part.

[41246] VGAM2951 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2951 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41247] An enzyme complex designated DICER COMPLEX, dices the VGAM2951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2951 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2951 RNA is designated SEQ ID:5726, and is provided hereinbelow with reference to the sequence listing part.

[41248] VGAM2951 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2951 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2951 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41249] VGAM2951 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2951 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2951 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2951 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2951 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41250] The complementary binding of VGAM2951 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2951 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2951 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2951 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41251] It is appreciated that VGAM2951 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2951 host target genes. The mRNA of each one of this plurality of VGAM2951 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2951 RNA, herein designated VGAM RNA, and which when bound by VGAM2951 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2951 host target proteins.

[41252] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2951 gene, herein designated VGAM GENE, on one or more VGAM2951 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41253] It is yet further appreciated that a function of VGAM2951 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2951 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific functions, and accordingly utilities, of VGAM2951 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM2951 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41254] Nucleotide sequences of the VGAM2951 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2951 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2951 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2951 are further described hereinbelow with reference to Table 1.

[41255] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2951 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41256] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2952 (VGAM2952) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[41257] VGAM2952 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2952 was detected is described hereinabove with reference to Figs. 2-8.

[41258] VGAM2952 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian-Human immunodeficiency virus. VGAM2952 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41259] VGAM2952 gene, herein designated VGAM GENE, encodes a VGAM2952 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2952 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2952 precursor RNA is designated SEQ ID:2659, and is provided hereinbelow with reference to the sequence listing part.

[41260] VGAM2952 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41261] An enzyme complex designated DICER COMPLEX, dices the VGAM2952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2952 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2952 RNA is designated SEQ ID:5729, and is provided hereinbelow with reference to the sequence listing part.

[41262] VGAM2952 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41263] VGAM2952 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2952 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2952 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41264] The complementary binding of VGAM2952 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2952 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2952 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41265] It is appreciated that VGAM2952 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2952 host target genes. The mRNA of each one of this plurality of VGAM2952 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2952 RNA, herein designated VGAM RNA, and which when bound by VGAM2952 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2952 host target proteins.

[41266] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2952 gene, herein designated VGAM GENE, on one or more VGAM2952 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41267] It is yet further appreciated that a function of VGAM2952 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2952 include diagnosis, prevention and treatment of viral infection by Simian-Human immunodeficiency virus. Specific functions, and accordingly utilities, of VGAM2952 correlate with, and may be deduced from,

the identity of the host target genes which VGAM2952 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41268] Nucleotide sequences of the VGAM2952 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2952 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2952 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2952 are further described hereinbelow with reference to Table 1.

[41269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2952 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41270] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2953 (VGAM2953) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41271] VGAM2953 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2953 was detected is described hereinabove with reference to Figs. 2-8.

[41272] VGAM2953 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2953 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41273] VGAM2953 gene, herein designated VGAM GENE, encodes a VGAM2953 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2953 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2953 precursor RNA is designated SEQ ID:2663, and is provided hereinbelow with reference to the sequence listing part.

[41274] VGAM2953 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41275] An enzyme complex designated DICER COMPLEX, dices the VGAM2953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2953 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2953 RNA is designated SEQ ID:5733, and is provided hereinbelow with reference to the sequence listing part.

[41276] VGAM2953 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41277] VGAM2953 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2953 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2953 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41278] The complementary binding of VGAM2953 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2953 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2953 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41279] It is appreciated that VGAM2953 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2953 host target genes. The mRNA of each one of this plurality of VGAM2953 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2953 RNA, herein designated VGAM RNA, and which when bound by VGAM2953 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2953 host target proteins.

[41280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2953 gene, herein designated VGAM GENE, on one or more VGAM2953 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41281] It is yet further appreciated that a function of VGAM2953 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2953 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2953 correlate with, and may be deduced from, the identity of the host target genes which

VGAM2953 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41282] Nucleotide sequences of the VGAM2953 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2953 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2953 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2953 are further described hereinbelow with reference to Table 1.

[41283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2953 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41284] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2954 (VGAM2954) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41285] VGAM2954 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2954 was detected is described hereinabove with reference to Figs. 2-8.

[41286] VGAM2954 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 7. VGAM2954 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41287] VGAM2954 gene, herein designated VGAM GENE, encodes a VGAM2954 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2954 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2954 precursor RNA is designated SEQ ID:2657, and is provided hereinbelow with reference to the sequence listing part.

[41288] VGAM2954 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41289] An enzyme complex designated DICER COMPLEX, dices the VGAM2954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2954 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2954 RNA is designated SEQ ID:5727, and is provided hereinbelow with reference to the sequence listing part.

[41290] VGAM2954 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41291] VGAM2954 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2954 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2954 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[41292] The complementary binding of VGAM2954 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2954 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2954 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41293] It is appreciated that VGAM2954 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2954 host target genes. The mRNA of each one of this plurality of VGAM2954 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2954 RNA, herein designated VGAM RNA, and which when bound by VGAM2954 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2954 host target proteins.

[41294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2954 gene, herein designated VGAM GENE, on one or more VGAM2954 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41295] It is yet further appreciated that a function of VGAM2954 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2954 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 7. Specific functions, and accordingly utilities, of VGAM2954 correlate with, and may be deduced from, the identity of the host target genes which VGAM2954 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[41296] Nucleotide sequences of the VGAM2954 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2954 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2954 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2954 are further described hereinbelow with reference to Table 1.

[41297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2954 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41298] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2955 (VGAM2955) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41299] VGAM2955 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2955 was detected is described hereinabove with reference to Figs. 2-8.

[41300] VGAM2955 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice grassy stunt virus. VGAM2955 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41301] VGAM2955 gene, herein designated VGAM GENE, encodes a VGAM2955 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2955 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2955 precursor RNA is designated SEQ ID:2658, and is provided hereinbelow with reference to the sequence listing part.

[41302] VGAM2955 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41303] An enzyme complex designated DICER COMPLEX, dices the VGAM2955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2955 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2955 RNA is designated SEQ ID:5728, and is provided hereinbelow with reference to the sequence listing part.

[41304] VGAM2955 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[41305] VGAM2955 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2955 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2955 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41306] The complementary binding of VGAM2955 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2955 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2955 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41307] It is appreciated that VGAM2955 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2955 host target genes. The mRNA of each one of this plurality of VGAM2955 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2955 RNA, herein designated VGAM RNA, and which when bound by VGAM2955 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2955 host target proteins.

[41308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2955 gene, herein designated VGAM GENE, on one

or more VGAM2955 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41309] It is yet further appreciated that a function of VGAM2955 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2955 include diagnosis, prevention and treatment of viral infection by Rice grassy stunt virus. Specific functions, and accordingly utilities, of VGAM2955 correlate with, and may be deduced from, the identity of the host target genes which VGAM2955 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41310] Nucleotide sequences of the VGAM2955 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2955 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2955 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2955 are further described hereinbelow with reference to Table 1.

[41311] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2955 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41312] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2956 (VGAM2956) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41313] VGAM2956 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2956 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[41314] VGAM2956 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Strawberry mild yellow edge virus. VGAM2956 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41315] VGAM2956 gene, herein designated VGAM GENE, encodes a VGAM2956 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2956 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2956 precursor RNA is designated SEQ ID:2660, and is provided hereinbelow with reference to the sequence listing part.

[41316] VGAM2956 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41317] An enzyme complex designated DICER COMPLEX, dices the VGAM2956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2956 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2956 RNA is designated SEQ ID:5730, and is provided hereinbelow with reference to the sequence listing part.

[41318] VGAM2956 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41319] VGAM2956 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2956 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2956 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41320] The complementary binding of VGAM2956 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2956 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2956 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41321] It is appreciated that VGAM2956 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2956 host target genes. The mRNA of each one of this plurality of VGAM2956 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2956 RNA, herein designated VGAM RNA, and which when bound by VGAM2956 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2956 host target proteins.

[41322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2956 gene, herein designated VGAM GENE, on one or more VGAM2956 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41323] It is yet further appreciated that a function of VGAM2956 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2956 include diagnosis, prevention and treatment of viral infection by Strawberry mild yellow edge virus. Specific functions, and accordingly utilities, of VGAM2956 correlate with, and may be deduced from, the identity of the host target genes which VGAM2956 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41324] Nucleotide sequences of the VGAM2956 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2956 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2956 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2956 are further described hereinbelow with reference to Table 1.

[41325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2956 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41326] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2957 (VGAM2957) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41327] VGAM2957 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2957 was detected is described hereinabove with reference to Figs. 2-8.

[41328] VGAM2957 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2957 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41329] VGAM2957 gene, herein designated VGAM GENE, encodes a VGAM2957 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2957 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2957 precursor RNA is designated SEQ ID:2661, and is provided hereinbelow with reference to the sequence listing part.

[41330] VGAM2957 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[41331] An enzyme complex designated DICER COMPLEX, dices the VGAM2957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2957 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2957 RNA is designated SEQ ID:5731, and is provided hereinbelow with reference to the sequence listing part.

[41332] VGAM2957 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41333] VGAM2957 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2957 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2957 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41334] The complementary binding of VGAM2957 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2957 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2957 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41335] It is appreciated that VGAM2957 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2957 host target genes. The mRNA of each one of this plurality of VGAM2957 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2957 RNA, herein designated VGAM RNA, and which when bound by VGAM2957 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2957 host target proteins.

[41336] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2957 gene, herein designated VGAM GENE, on one or more VGAM2957 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41337] It is yet further appreciated that a function of VGAM2957 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2957 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2957 correlate with, and may be deduced from, the identity of the host target genes which VGAM2957 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41338] Nucleotide sequences of the VGAM2957 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2957 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2957 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2957 are further described hereinbelow with reference to Table 1.

[41339] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2957 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41340] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2958 (VGAM2958) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41341] VGAM2958 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2958 was detected is described hereinabove with reference to Figs. 2-8.

[41342] VGAM2958 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 1. VGAM2958 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41343] VGAM2958 gene, herein designated VGAM GENE, encodes a VGAM2958 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2958 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2958 precursor RNA is designated SEQ ID:2664, and is provided hereinbelow with reference to the sequence listing part.

[41344] VGAM2958 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41345] An enzyme complex designated DICER COMPLEX, dices the VGAM2958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2958 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2958 RNA is designated SEQ ID:5734, and is provided hereinbelow with reference to the sequence listing part.

[41346] VGAM2958 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2958 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2958 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41347] VGAM2958 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2958 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2958 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2958 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2958 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41348] The complementary binding of VGAM2958 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2958 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2958 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2958 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41349] It is appreciated that VGAM2958 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2958 host target genes. The mRNA of each one of this plurality of VGAM2958 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2958 RNA, herein designated VGAM RNA, and which when bound by VGAM2958 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2958 host target proteins.

[41350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2958 gene, herein designated VGAM GENE, on one or more VGAM2958 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41351] It is yet further appreciated that a function of VGAM2958 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2958 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2958 correlate with, and may be deduced from, the identity of the host target genes which VGAM2958 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41352] Nucleotide sequences of the VGAM2958 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2958 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2958 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2958 are further described hereinbelow with reference to Table 1.

[41353] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2958 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41354] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2959 (VGAM2959) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41355] VGAM2959 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2959 was detected is described hereinabove with reference to Figs. 2-8.

[41356] VGAM2959 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5.

VGAM2959 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41357] VGAM2959 gene, herein designated VGAM GENE, encodes a VGAM2959 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2959 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2959 precursor RNA is designated SEQ ID:2665, and is provided hereinbelow with reference to the sequence listing part.

[41358] VGAM2959 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41359] An enzyme complex designated DICER COMPLEX, dices

the VGAM2959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2959 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2959 RNA is designated SEQ ID:5735, and is provided hereinbelow with reference to the sequence listing part.

[41360] VGAM2959 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2959 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2959 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41361] VGAM2959 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2959 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2959 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2959 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2959 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41362] The complementary binding of VGAM2959 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2959 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2959 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2959 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41363] It is appreciated that VGAM2959 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2959 host target genes. The mRNA of each one of this plurality of VGAM2959 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2959 RNA, herein designated VGAM RNA, and which when bound by VGAM2959 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2959 host target proteins.

[41364] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2959 gene, herein designated VGAM GENE, on one or more VGAM2959 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41365] It is yet further appreciated that a function of VGAM2959 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2959 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2959 correlate with, and may be deduced from, the identity of the host target genes which VGAM2959 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41366] Nucleotide sequences of the VGAM2959 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2959 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2959 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2959 are further described hereinbelow with reference to Table 1.

[41367] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2959 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41368] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2960 (VGAM2960) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41369] VGAM2960 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2960 was detected is described hereinabove with reference to Figs. 2-8.

[41370] VGAM2960 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine rhinovirus 3. VGAM2960 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[41371] VGAM2960 gene, herein designated VGAM GENE, encodes a VGAM2960 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2960 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2960 precursor RNA is designated SEQ ID:2662, and is provided hereinbelow with reference to the sequence listing part.

[41372] VGAM2960 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2960 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41373] An enzyme complex designated DICER COMPLEX, dices the VGAM2960 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2960 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2960 RNA is designated SEQ ID:5732, and is provided hereinbelow with reference to the sequence listing part.

[41374] VGAM2960 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2960 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2960 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41375] VGAM2960 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2960 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2960 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2960 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2960 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41376] The complementary binding of VGAM2960 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2960 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2960

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2960 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41377] It is appreciated that VGAM2960 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2960 host target genes. The mRNA of each one of this plurality of VGAM2960 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2960 RNA, herein designated VGAM RNA, and which when bound by VGAM2960 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2960 host target proteins.

[41378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2960 gene, herein designated VGAM GENE, on one or more VGAM2960 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41379] It is yet further appreciated that a function of VGAM2960 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2960 include diagnosis, prevention and treatment of viral infection by Equine rhinovirus 3. Specific functions, and accordingly utilities, of VGAM2960 correlate with, and may be deduced from, the identity of the host target genes which VGAM2960 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41380] Nucleotide sequences of the VGAM2960 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2960 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2960 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2960 are further described hereinbelow with reference to Table 1.

[41381] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2960 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41382] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2961 (VGAM2961) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41383] VGAM2961 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2961 was detected is described hereinabove with reference to Figs. 2-8.

[41384] VGAM2961 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca mulatta rhadinovirus. VGAM2961 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[41385] VGAM2961 gene, herein designated VGAM GENE, encodes a VGAM2961 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2961 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2961 precursor RNA is designated SEQ ID:2666, and is provided hereinbelow with reference to the sequence listing part.

[41386] VGAM2961 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41387] An enzyme complex designated DICER COMPLEX, dices the VGAM2961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2961 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2961 RNA is designated SEQ ID:5736, and is provided hereinbelow with reference to the sequence listing part.

[41388] VGAM2961 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2961 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2961 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41389] VGAM2961 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2961 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2961 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2961 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2961 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41390] The complementary binding of VGAM2961 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2961 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2961 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2961 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41391] It is appreciated that VGAM2961 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2961 host target genes. The mRNA of each one of this plurality of VGAM2961 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2961 RNA, herein designated VGAM RNA, and which when bound by VGAM2961 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2961 host target proteins.

[41392] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2961 gene, herein designated VGAM GENE, on one or more VGAM2961 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41393] It is yet further appreciated that a function of VGAM2961 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2961 include diagnosis, prevention and treatment of viral infection by Macaca mulatta rhadinovirus. Specific functions, and accordingly utilities, of VGAM2961 correlate with, and may be deduced from, the identity of the host target genes which VGAM2961 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41394] Nucleotide sequences of the VGAM2961 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2961 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2961 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2961 are further

described hereinbelow with reference to Table 1.

[41395] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2961 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41396] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2962 (VGAM2962) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41397] VGAM2962 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2962 was detected is described hereinabove with reference to Figs. 2-8.

[41398] VGAM2962 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea seed-borne mosaic virus. VGAM2962 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41399] VGAM2962 gene, herein designated VGAM GENE, encodes a VGAM2962 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2962 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2962 precursor RNA is designated SEQ ID:2667, and is provided hereinbelow with reference to the sequence listing part.

[41400] VGAM2962 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41401] An enzyme complex designated DICER COMPLEX, dices the VGAM2962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2962 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2962 RNA is designated SEQ ID:5737, and is provided hereinbelow with reference to the sequence listing part.

[41402] VGAM2962 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41403] VGAM2962 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2962 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2962 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41404] The complementary binding of VGAM2962 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2962 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2962 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41405] It is appreciated that VGAM2962 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2962 host target genes. The mRNA of each one of this plurality of VGAM2962 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2962 RNA, herein designated VGAM RNA, and which when bound by VGAM2962 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2962 host target proteins.

[41406] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2962 gene, herein designated VGAM GENE, on one or more VGAM2962 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41407] It is yet further appreciated that a function of VGAM2962 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2962 include diagnosis, prevention and treatment of viral infection by Pea seed-borne mosaic virus. Specific functions, and accordingly utilities, of VGAM2962 correlate with, and may be deduced from, the identity of the host target genes which VGAM2962 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41408] Nucleotide sequences of the VGAM2962 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2962 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2962 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2962 are further described hereinbelow with reference to Table 1.

[41409] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2962 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41410] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2963 (VGAM2963) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41411] VGAM2963 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2963 was detected is described hereinabove with reference to Figs. 2-8.

[41412] VGAM2963 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Satellite virus of maize white line mosaic virus. VGAM2963 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41413] VGAM2963 gene, herein designated VGAM GENE, encodes

a VGAM2963 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2963 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2963 precursor RNA is designated SEQ ID:2673, and is provided hereinbelow with reference to the sequence listing part.

[41414] VGAM2963 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41415] An enzyme complex designated DICER COMPLEX, dices the VGAM2963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2963 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2963 RNA is designated SEQ ID:5743, and is provided hereinbelow with reference to the sequence listing part.

[41416] VGAM2963 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41417] VGAM2963 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2963 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2963 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41418] The complementary binding of VGAM2963 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2963 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2963 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[41419] It is appreciated that VGAM2963 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2963 host target genes. The mRNA of each one of this plurality of VGAM2963 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2963 RNA, herein designated VGAM RNA, and which when bound by VGAM2963 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2963 host target proteins.

[41420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2963 gene, herein designated VGAM GENE, on one or more VGAM2963 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41421] It is yet further appreciated that a function of VGAM2963 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2963 include diagnosis, prevention and treatment of viral infection by Satellite virus of maize white line mosaic virus. Specific functions, and accordingly utilities, of VGAM2963 correlate with, and may be deduced from, the identity of the host target genes which VGAM2963 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41422] Nucleotide sequences of the VGAM2963 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2963 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2963 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2963 are further described hereinbelow with reference to Table 1.

[41423] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2963 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41424] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2964 (VGAM2964) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41425] VGAM2964 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2964 was detected is described hereinabove with reference to Figs. 2-8.

[41426] VGAM2964 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM2964 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41427] VGAM2964 gene, herein designated VGAM GENE, encodes a VGAM2964 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2964 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2964 precursor RNA is designated SEQ ID:2668, and is provided hereinbelow with reference to the sequence listing part.

[41428] VGAM2964 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41429] An enzyme complex designated DICER COMPLEX, dices the VGAM2964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2964 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2964 RNA is designated SEQ ID:5738, and is provided hereinbelow with reference to the sequence listing part.

[41430] VGAM2964 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41431] VGAM2964 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2964 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2964 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41432] The complementary binding of VGAM2964 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2964 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2964 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41433] It is appreciated that VGAM2964 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2964 host target genes. The mRNA of each one of this plurality of VGAM2964 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2964 RNA, herein designated VGAM RNA, and which when bound by VGAM2964 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2964 host target proteins.

[41434] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2964 gene, herein designated VGAM GENE, on one or more VGAM2964 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41435] It is yet further appreciated that a function of VGAM2964 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2964 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2964 correlate with, and may be deduced from, the identity of the host target genes which VGAM2964 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41436] Nucleotide sequences of the VGAM2964 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2964 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2964 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2964 are further described hereinbelow with reference to Table 1.

[41437] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2964 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41438] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2965 (VGAM2965) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41439] VGAM2965 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2965 was detected is described hereinabove with reference to Figs. 2-8.

[41440] VGAM2965 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM2965 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41441] VGAM2965 gene, herein designated VGAM GENE, encodes a VGAM2965 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2965 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2965 precursor RNA is designated SEQ ID:2669, and is provided hereinbelow with reference to the sequence listing part.

[41442] VGAM2965 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41443] An enzyme complex designated DICER COMPLEX, dices the VGAM2965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2965 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM2965 RNA is designated SEQ ID:5739, and is provided hereinbelow with reference to the sequence listing part.

[41444] VGAM2965 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41445] VGAM2965 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2965 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2965 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41446] The complementary binding of VGAM2965 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2965 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2965 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41447] It is appreciated that VGAM2965 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2965 host target genes. The mRNA of each one of this plurality of VGAM2965 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2965 RNA, herein designated VGAM RNA, and which when bound by VGAM2965 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2965 host target proteins.

[41448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2965 gene, herein designated VGAM GENE, on one or more VGAM2965 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41449] It is yet further appreciated that a function of VGAM2965 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2965 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM2965 correlate with, and may be deduced from, the identity of the host target genes which VGAM2965 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41450] Nucleotide sequences of the VGAM2965 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2965 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2965 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2965 are further described hereinbelow with reference to Table 1.

[41451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2965 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41452] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2966 (VGAM2966) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41453] VGAM2966 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2966 was detected is described hereinabove with reference to Figs. 2-8.

[41454] VGAM2966 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM2966 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41455] VGAM2966 gene, herein designated VGAM GENE, encodes a VGAM2966 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2966 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2966 precursor RNA is designated SEQ ID:2674, and is provided hereinbelow with reference to the sequence listing part.

[41456] VGAM2966 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41457] An enzyme complex designated DICER COMPLEX, dices the VGAM2966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2966 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 80%) nucleotide sequence of VGAM2966 RNA is designated SEQ ID:5744, and is provided hereinbelow with reference to the sequence listing part.

[41458] VGAM2966 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41459] VGAM2966 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2966 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2966 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41460] The complementary binding of VGAM2966 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2966 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2966 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41461] It is appreciated that VGAM2966 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2966 host target genes. The mRNA of each one of this plurality of VGAM2966 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2966 RNA, herein designated VGAM RNA, and which when bound by VGAM2966 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2966 host target proteins.

[41462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2966 gene, herein designated VGAM GENE, on one or more VGAM2966 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41463] It is yet further appreciated that a function of VGAM2966 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2966 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM2966 correlate with, and may be deduced from, the identity of the host target genes which VGAM2966 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41464] Nucleotide sequences of the VGAM2966 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2966 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2966 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2966 are further described hereinbelow with reference to Table 1.

[41465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2966 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41466] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2967 (VGAM2967) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41467] VGAM2967 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2967 was detected is described hereinabove with reference to Figs. 2-8.

[41468] VGAM2967 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Planococcus citri densovirus. VGAM2967 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41469] VGAM2967 gene, herein designated VGAM GENE, encodes a VGAM2967 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2967 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2967 precursor RNA is designated SEQ ID:2681, and is provided hereinbelow with reference to the sequence listing part.

[41470] VGAM2967 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41471] An enzyme complex designated DICER COMPLEX, dices the VGAM2967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2967 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2967 RNA is designated SEQ ID:5751, and is provided hereinbelow with reference to the sequence listing part.

[41472] VGAM2967 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41473] VGAM2967 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2967 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2967 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41474] The complementary binding of VGAM2967 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2967 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2967 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41475] It is appreciated that VGAM2967 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2967 host target genes. The mRNA of

each one of this plurality of VGAM2967 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2967 RNA, herein designated VGAM RNA, and which when bound by VGAM2967 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2967 host target proteins.

[41476] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2967 gene, herein designated VGAM GENE, on one or more VGAM2967 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[41477] It is yet further appreciated that a function of VGAM2967 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2967 include diagnosis, prevention and treatment of viral infection by Planococcus citri denso-virus. Specific functions, and accordingly utilities, of VGAM2967 correlate with, and may be deduced from, the identity of the host target genes which VGAM2967 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41478] Nucleotide sequences of the VGAM2967 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2967 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2967 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2967 are further described hereinbelow with reference to Table 1.

[41479] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2967 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[41480] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2968 (VGAM2968) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41481] VGAM2968 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2968 was detected is described hereinabove with reference to Figs. 2-8.

[41482] VGAM2968 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichomonas vaginalis virus 3. VGAM2968 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41483] VGAM2968 gene, herein designated VGAM GENE, encodes a VGAM2968 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2968 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2968 precursor RNA is designated SEQ ID:2675, and is provided hereinbelow with reference to the sequence listing part.

[41484] VGAM2968 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41485] An enzyme complex designated DICER COMPLEX, dices the VGAM2968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2968 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2968 RNA is designated SEQ ID:5745, and

is provided hereinbelow with reference to the sequence listing part.

[41486] VGAM2968 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41487] VGAM2968 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2968 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2968 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41488] The complementary binding of VGAM2968 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2968 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2968 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41489] It is appreciated that VGAM2968 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2968 host target genes. The mRNA of each one of this plurality of VGAM2968 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2968 RNA, herein designated VGAM RNA, and which when bound by VGAM2968 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2968 host target proteins.

[41490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2968 gene, herein designated VGAM GENE, on one or more VGAM2968 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41491] It is yet further appreciated that a function of VGAM2968 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2968 include diagnosis, prevention and treatment of viral infection by Trichomonas vaginalis virus 3. Specific functions, and accordingly utilities, of VGAM2968 correlate with, and may be deduced from, the identity of the host target genes which VGAM2968 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41492] Nucleotide sequences of the VGAM2968 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2968 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2968 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2968 are further described hereinbelow with reference to Table 1.

[41493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2968 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41494] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2969 (VGAM2969) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41495] VGAM2969 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2969 was detected is described hereinabove with reference to Figs. 2-8.

[41496] VGAM2969 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine herpesvirus 1. VGAM2969 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41497] VGAM2969 gene, herein designated VGAM GENE, encodes a VGAM2969 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2969 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2969 precur-

sor RNA is designated SEQ ID:2682, and is provided hereinbelow with reference to the sequence listing part.

[41498] VGAM2969 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41499] An enzyme complex designated DICER COMPLEX, dices the VGAM2969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2969 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2969 RNA is designated SEQ ID:5752, and is provided hereinbelow with reference to the sequence

listing part.

[41500] VGAM2969 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41501] VGAM2969 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2969 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM2969 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41502] The complementary binding of VGAM2969 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2969 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2969 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41503] It is appreciated that VGAM2969 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2969 host target genes. The mRNA of each one of this plurality of VGAM2969 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM2969 RNA, herein designated VGAM RNA, and which when bound by VGAM2969 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2969 host target proteins.

[41504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2969 gene, herein designated VGAM GENE, on one or more VGAM2969 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41505] It is yet further appreciated that a function of VGAM2969

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2969 include diagnosis, prevention and treatment of viral infection by Alcelaphine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2969 correlate with, and may be deduced from, the identity of the host target genes which VGAM2969 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41506] Nucleotide sequences of the VGAM2969 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2969 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2969 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2969 are further described hereinbelow with reference to Table 1.

[41507] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2969 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41508] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2970 (VGAM2970) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41509] VGAM2970 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2970 was detected is described hereinabove with reference to Figs. 2-8.

[41510] VGAM2970 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola virus. VGAM2970 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41511] VGAM2970 gene, herein designated VGAM GENE, encodes a VGAM2970 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2970 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2970 precursor RNA is designated SEQ ID:2670, and is provided hereinbelow with reference to the sequence listing part.

[41512] VGAM2970 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41513] An enzyme complex designated DICER COMPLEX, dices the VGAM2970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2970 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2970 RNA is designated SEQ ID:5740, and is provided hereinbelow with reference to the sequence listing part.

[41514] VGAM2970 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41515] VGAM2970 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2970 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2970 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41516] The complementary binding of VGAM2970 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2970 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2970 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41517] It is appreciated that VGAM2970 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2970 host target genes. The mRNA of each one of this plurality of VGAM2970 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2970 RNA, herein designated VGAM

RNA, and which when bound by VGAM2970 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2970 host target proteins.

[41518] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2970 gene, herein designated VGAM GENE, on one or more VGAM2970 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41519] It is yet further appreciated that a function of VGAM2970 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM2970 include diagnosis, prevention and treatment of viral infection by Variola virus. Specific functions, and accordingly utilities, of VGAM2970 correlate with, and may be deduced from, the identity of the host target genes which VGAM2970 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41520] Nucleotide sequences of the VGAM2970 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2970 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2970 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2970 are further described hereinbelow with reference to Table 1.

[41521] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2970 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41522] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 2971 (VGAM2971) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41523] VGAM2971 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2971 was detected is described hereinabove with reference to Figs. 2-8.

[41524] VGAM2971 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-2. VGAM2971 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41525] VGAM2971 gene, herein designated VGAM GENE, encodes a VGAM2971 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2971 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2971 precursor RNA is designated SEQ ID:2683, and is provided hereinbelow with reference to the sequence listing part.

[41526] VGAM2971 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM2971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41527] An enzyme complex designated DICER COMPLEX, dices the VGAM2971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2971 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2971 RNA is designated SEQ ID:5753, and is provided hereinbelow with reference to the sequence listing part.

[41528] VGAM2971 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM2971 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2971 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41529] VGAM2971 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2971 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2971 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2971 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2971 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41530] The complementary binding of VGAM2971 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2971 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2971 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2971 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41531] It is appreciated that VGAM2971 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2971 host target genes. The mRNA of each one of this plurality of VGAM2971 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2971 RNA, herein designated VGAM RNA, and which when bound by VGAM2971 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2971 host target proteins.

[41532] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2971 gene, herein designated VGAM GENE, on one or more VGAM2971 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41533] It is yet further appreciated that a function of VGAM2971 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2971 include diagnosis, prevention and

treatment of viral infection by Sulfolobus virus SIRV-2. Specific functions, and accordingly utilities, of VGAM2971 correlate with, and may be deduced from, the identity of the host target genes which VGAM2971 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41534] Nucleotide sequences of the VGAM2971 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2971 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2971 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2971 are further described hereinbelow with reference to Table 1.

[41535] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2971 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41536] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2972 (VGAM2972) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41537] VGAM2972 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2972 was detected is described hereinabove with reference to Figs. 2-8.

[41538] VGAM2972 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murid herpesvirus 4. VGAM2972 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41539] VGAM2972 gene, herein designated VGAM GENE, encodes a VGAM2972 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2972 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2972 precursor RNA is designated SEQ ID:2671, and is provided hereinbelow with reference to the sequence listing part.

[41540] VGAM2972 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2972 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41541] An enzyme complex designated DICER COMPLEX, dices the VGAM2972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2972 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2972 RNA is designated SEQ ID:5741, and is provided hereinbelow with reference to the sequence listing part.

[41542] VGAM2972 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2972 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM2972 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41543] VGAM2972 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2972 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2972 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2972 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2972 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41544] The complementary binding of VGAM2972 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2972 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2972 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2972 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41545] It is appreciated that VGAM2972 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2972 host target genes. The mRNA of each one of this plurality of VGAM2972 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2972 RNA, herein designated VGAM RNA, and which when bound by VGAM2972 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM2972 host target proteins.

[41546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2972 gene, herein designated VGAM GENE, on one or more VGAM2972 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41547] It is yet further appreciated that a function of VGAM2972 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2972 include diagnosis, prevention and treatment of viral infection by Murid herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM2972 correlate with, and may be deduced from, the identity of the host target genes which VGAM2972 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41548] Nucleotide sequences of the VGAM2972 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2972 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2972 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2972 are further described hereinbelow with reference to Table 1.

[41549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2972 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41550] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2973 (VGAM2973) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[41551] VGAM2973 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2973 was detected is described hereinabove with reference to Figs. 2-8.

[41552] VGAM2973 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Trichomonas vaginalis virus 3. VGAM2973 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41553] VGAM2973 gene, herein designated VGAM GENE, encodes a VGAM2973 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2973 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2973 precursor RNA is designated SEQ ID:2672, and is provided hereinbelow with reference to the sequence listing part.

[41554] VGAM2973 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2973 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41555] An enzyme complex designated DICER COMPLEX, dices the VGAM2973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2973 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2973 RNA is designated SEQ ID:5742, and is provided hereinbelow with reference to the sequence listing part.

[41556] VGAM2973 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2973 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2973 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41557] VGAM2973 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2973 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2973 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2973 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2973 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41558] The complementary binding of VGAM2973 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2973 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2973 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2973 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41559] It is appreciated that VGAM2973 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2973 host target genes. The mRNA of each one of this plurality of VGAM2973 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2973 RNA, herein designated VGAM RNA, and which when bound by VGAM2973 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2973 host target proteins.

[41560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2973 gene, herein designated VGAM GENE, on one or more VGAM2973 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41561] It is yet further appreciated that a function of VGAM2973 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2973 include diagnosis, prevention and treatment of viral infection by Trichomonas vaginalis virus 3. Specific functions, and accordingly utilities, of

VGAM2973 correlate with, and may be deduced from, the identity of the host target genes which VGAM2973 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41562] Nucleotide sequences of the VGAM2973 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2973 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2973 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2973 are further described hereinbelow with reference to Table 1.

[41563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2973 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41564] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2974 (VGAM2974) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[41565] VGAM2974 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2974 was detected is described hereinabove with reference to Figs. 2-8.

[41566] VGAM2974 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ictalurid herpesvirus 1. VGAM2974 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41567] VGAM2974 gene, herein designated VGAM GENE, encodes a VGAM2974 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2974 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2974 precursor RNA is designated SEQ ID:2687, and is provided hereinbelow with reference to the sequence listing part.

[41568] VGAM2974 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41569] An enzyme complex designated DICER COMPLEX, dices the VGAM2974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2974 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2974 RNA is designated SEQ ID:5757, and is provided hereinbelow with reference to the sequence listing part.

[41570] VGAM2974 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41571] VGAM2974 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2974 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2974 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41572] The complementary binding of VGAM2974 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2974 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2974 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41573] It is appreciated that VGAM2974 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2974 host target genes. The mRNA of each one of this plurality of VGAM2974 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2974 RNA, herein designated VGAM RNA, and which when bound by VGAM2974 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2974 host target proteins.

[41574] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2974 gene, herein designated VGAM GENE, on one or more VGAM2974 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41575] It is yet further appreciated that a function of VGAM2974 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2974 include diagnosis, prevention and treatment of viral infection by Ictalurid herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2974 correlate with, and may be deduced from, the identity of

the host target genes which VGAM2974 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41576] Nucleotide sequences of the VGAM2974 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2974 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2974 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2974 are further described hereinbelow with reference to Table 1.

[41577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2974 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41578] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2975 (VGAM2975) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41579] VGAM2975 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2975 was detected is described hereinabove with reference to Figs. 2-8.

[41580] VGAM2975 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus. VGAM2975 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41581] VGAM2975 gene, herein designated VGAM GENE, encodes a VGAM2975 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2975 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2975 precursor RNA is designated SEQ ID:2676, and is provided hereinbelow with reference to the sequence listing part.

[41582] VGAM2975 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41583] An enzyme complex designated DICER COMPLEX, dices the VGAM2975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2975 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2975 RNA is designated SEQ ID:5746, and is provided hereinbelow with reference to the sequence listing part.

[41584] VGAM2975 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41585] VGAM2975 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2975 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2975 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41586] The complementary binding of VGAM2975 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2975 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2975 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41587] It is appreciated that VGAM2975 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2975 host target genes. The mRNA of each one of this plurality of VGAM2975 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2975 RNA, herein designated VGAM RNA, and which when bound by VGAM2975 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2975 host target proteins.

[41588] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2975 gene, herein designated VGAM GENE, on one or more VGAM2975 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41589] It is yet further appreciated that a function of VGAM2975 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2975 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM2975 correlate with, and may be deduced from, the identity of the host target genes which VGAM2975 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[41590] Nucleotide sequences of the VGAM2975 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2975 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2975 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2975 are further described hereinbelow with reference to Table 1.

[41591] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2975 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41592] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2976 (VGAM2976) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41593] VGAM2976 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2976 was detected is described hereinabove with reference to Figs. 2-8.

[41594] VGAM2976 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lumpy skin disease virus. VGAM2976 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41595] VGAM2976 gene, herein designated VGAM GENE, encodes a VGAM2976 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2976 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2976 precursor RNA is designated SEQ ID:2677, and is provided hereinbelow with reference to the sequence listing part.

[41596] VGAM2976 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41597] An enzyme complex designated DICER COMPLEX, dices the VGAM2976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2976 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2976 RNA is designated SEQ ID:5747, and is provided hereinbelow with reference to the sequence listing part.

[41598] VGAM2976 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41599] VGAM2976 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2976 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2976 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[41600] The complementary binding of VGAM2976 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2976 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2976 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41601] It is appreciated that VGAM2976 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2976 host target genes. The mRNA of each one of this plurality of VGAM2976 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2976 RNA, herein designated VGAM RNA, and which when bound by VGAM2976 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2976 host target proteins.

[41602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2976 gene, herein designated VGAM GENE, on one or more VGAM2976 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41603] It is yet further appreciated that a function of VGAM2976 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2976 include diagnosis, prevention and treatment of viral infection by Lumpy skin disease virus. Specific functions, and accordingly utilities, of VGAM2976 correlate with, and may be deduced from, the identity of the host target genes which VGAM2976 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[41604] Nucleotide sequences of the VGAM2976 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2976 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2976 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2976 are further described hereinbelow with reference to Table 1.

[41605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2976 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41606] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2977 (VGAM2977) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41607] VGAM2977 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2977 was detected is described hereinabove with reference to Figs. 2-8.

[41608] VGAM2977 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Amsacta moorei entomopoxvirus. VGAM2977 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41609] VGAM2977 gene, herein designated VGAM GENE, encodes a VGAM2977 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2977 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2977 precursor RNA is designated SEQ ID:2678, and is provided hereinbelow with reference to the sequence listing part.

[41610] VGAM2977 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41611] An enzyme complex designated DICER COMPLEX, dices the VGAM2977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2977 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2977 RNA is designated SEQ ID:5748, and is provided hereinbelow with reference to the sequence listing part.

[41612] VGAM2977 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[41613] VGAM2977 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2977 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2977 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41614] The complementary binding of VGAM2977 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2977 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2977 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41615] It is appreciated that VGAM2977 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2977 host target genes. The mRNA of each one of this plurality of VGAM2977 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2977 RNA, herein designated VGAM RNA, and which when bound by VGAM2977 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2977 host target proteins.

[41616] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2977 gene, herein designated VGAM GENE, on one

or more VGAM2977 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41617] It is yet further appreciated that a function of VGAM2977 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2977 include diagnosis, prevention and treatment of viral infection by Amsacta moorei entomopoxvirus. Specific functions, and accordingly utilities, of VGAM2977 correlate with, and may be deduced from, the identity of the host target genes which VGAM2977 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41618] Nucleotide sequences of the VGAM2977 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2977 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2977 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2977 are further described hereinbelow with reference to Table 1.

[41619] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2977 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41620] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2978 (VGAM2978) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41621] VGAM2978 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2978 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[41622] VGAM2978 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2978 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41623] VGAM2978 gene, herein designated VGAM GENE, encodes a VGAM2978 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2978 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2978 precursor RNA is designated SEQ ID:2679, and is provided hereinbelow with reference to the sequence listing part.

[41624] VGAM2978 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41625] An enzyme complex designated DICER COMPLEX, dices the VGAM2978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2978 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2978 RNA is designated SEQ ID:5749, and is provided hereinbelow with reference to the sequence listing part.

[41626] VGAM2978 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41627] VGAM2978 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2978 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2978 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41628] The complementary binding of VGAM2978 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2978 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2978 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41629] It is appreciated that VGAM2978 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2978 host target genes. The mRNA of each one of this plurality of VGAM2978 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2978 RNA, herein designated VGAM RNA, and which when bound by VGAM2978 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2978 host target proteins.

[41630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2978 gene, herein designated VGAM GENE, on one or more VGAM2978 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41631] It is yet further appreciated that a function of VGAM2978 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2978 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2978 correlate with, and may be deduced from, the identity of the host target genes which VGAM2978 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41632] Nucleotide sequences of the VGAM2978 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2978 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2978 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2978 are further described hereinbelow with reference to Table 1.

[41633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2978 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41634] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2979 (VGAM2979) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41635] VGAM2979 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2979 was detected is described hereinabove with reference to Figs. 2-8.

[41636] VGAM2979 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Phocoena spinipinnis papillomavirus. VGAM2979 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41637] VGAM2979 gene, herein designated VGAM GENE, encodes a VGAM2979 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2979 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2979 precursor RNA is designated SEQ ID:2684, and is provided hereinbelow with reference to the sequence listing part.

[41638] VGAM2979 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[41639] An enzyme complex designated DICER COMPLEX, dices the VGAM2979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2979 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2979 RNA is designated SEQ ID:5754, and is provided hereinbelow with reference to the sequence listing part.

[41640] VGAM2979 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41641] VGAM2979 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2979 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2979 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41642] The complementary binding of VGAM2979 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2979 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2979 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41643] It is appreciated that VGAM2979 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2979 host target genes. The mRNA of each one of this plurality of VGAM2979 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2979 RNA, herein designated VGAM RNA, and which when bound by VGAM2979 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2979 host target proteins.

[41644] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2979 gene, herein designated VGAM GENE, on one or more VGAM2979 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41645] It is yet further appreciated that a function of VGAM2979 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2979 include diagnosis, prevention and treatment of viral infection by Phocoena spinipinnis papillomavirus. Specific functions, and accordingly utilities, of VGAM2979 correlate with, and may be deduced from, the identity of the host target genes which VGAM2979 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41646] Nucleotide sequences of the VGAM2979 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2979 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2979 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2979 are further described hereinbelow with reference to Table 1.

[41647] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2979 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41648] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2980 (VGAM2980) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41649] VGAM2980 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2980 was detected is described hereinabove with reference to Figs. 2-8.

[41650] VGAM2980 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of African swine fever virus. VGAM2980 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41651] VGAM2980 gene, herein designated VGAM GENE, encodes a VGAM2980 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2980 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2980 precursor RNA is designated SEQ ID:2680, and is provided hereinbelow with reference to the sequence listing part.

[41652] VGAM2980 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41653] An enzyme complex designated DICER COMPLEX, dices the VGAM2980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2980 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2980 RNA is designated SEQ ID:5750, and is provided hereinbelow with reference to the sequence listing part.

[41654] VGAM2980 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2980 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2980 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41655] VGAM2980 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2980 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2980 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2980 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2980 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41656] The complementary binding of VGAM2980 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2980 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2980 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2980 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41657] It is appreciated that VGAM2980 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2980 host target genes. The mRNA of each one of this plurality of VGAM2980 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2980 RNA, herein designated VGAM RNA, and which when bound by VGAM2980 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2980 host target proteins.

[41658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2980 gene, herein designated VGAM GENE, on one or more VGAM2980 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41659] It is yet further appreciated that a function of VGAM2980 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2980 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM2980 correlate with, and may be deduced from, the identity of the host target genes which VGAM2980 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41660] Nucleotide sequences of the VGAM2980 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2980 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2980 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2980 are further described hereinbelow with reference to Table 1.

[41661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2980 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41662] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2981 (VGAM2981) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41663] VGAM2981 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2981 was detected is described hereinabove with reference to Figs. 2-8.

[41664] VGAM2981 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sulfolobus virus SIRV-1.

VGAM2981 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41665] VGAM2981 gene, herein designated VGAM GENE, encodes a VGAM2981 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2981 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2981 precursor RNA is designated SEQ ID:2685, and is provided hereinbelow with reference to the sequence listing part.

[41666] VGAM2981 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41667] An enzyme complex designated DICER COMPLEX, dices

the VGAM2981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2981 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2981 RNA is designated SEQ ID:5755, and is provided hereinbelow with reference to the sequence listing part.

[41668] VGAM2981 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2981 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2981 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41669] VGAM2981 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2981 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2981 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2981 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2981 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41670] The complementary binding of VGAM2981 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2981 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2981 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2981 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41671] It is appreciated that VGAM2981 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2981 host target genes. The mRNA of each one of this plurality of VGAM2981 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2981 RNA, herein designated VGAM RNA, and which when bound by VGAM2981 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2981 host target proteins.

[41672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2981 gene, herein designated VGAM GENE, on one or more VGAM2981 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41673] It is yet further appreciated that a function of VGAM2981 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2981 include diagnosis, prevention and treatment of viral infection by Sulfolobus virus SIRV-1. Specific functions, and accordingly utilities, of VGAM2981 correlate with, and may be deduced from, the identity of the host target genes which VGAM2981 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41674] Nucleotide sequences of the VGAM2981 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2981 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2981 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2981 are further described hereinbelow with reference to Table 1.

[41675] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2981 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41676] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2982 (VGAM2982) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41677] VGAM2982 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2982 was detected is described hereinabove with reference to Figs. 2-8.

[41678] VGAM2982 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox virus. VGAM2982 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[41679] VGAM2982 gene, herein designated VGAM GENE, encodes a VGAM2982 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2982 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2982 precursor RNA is designated SEQ ID:2686, and is provided hereinbelow with reference to the sequence listing part.

[41680] VGAM2982 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2982 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41681] An enzyme complex designated DICER COMPLEX, dices the VGAM2982 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2982 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2982 RNA is designated SEQ ID:5756, and is provided hereinbelow with reference to the sequence listing part.

[41682] VGAM2982 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2982 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2982 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41683] VGAM2982 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2982 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2982 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2982 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2982 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41684] The complementary binding of VGAM2982 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2982 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2982

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2982 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41685] It is appreciated that VGAM2982 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2982 host target genes. The mRNA of each one of this plurality of VGAM2982 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2982 RNA, herein designated VGAM RNA, and which when bound by VGAM2982 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2982 host target proteins.

[41686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2982 gene, herein designated VGAM GENE, on one or more VGAM2982 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41687] It is yet further appreciated that a function of VGAM2982 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2982 include diagnosis, prevention and treatment of viral infection by Camelpox virus. Specific functions, and accordingly utilities, of VGAM2982 correlate with, and may be deduced from, the identity of the host target genes which VGAM2982 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41688] Nucleotide sequences of the VGAM2982 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2982 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2982 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2982 are further described hereinbelow with reference to Table 1.

[41689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2982 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41690] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2983 (VGAM2983) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41691] VGAM2983 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2983 was detected is described hereinabove with reference to Figs. 2-8.

[41692] VGAM2983 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM2983 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[41693] VGAM2983 gene, herein designated VGAM GENE, encodes a VGAM2983 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2983 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2983 precursor RNA is designated SEQ ID:2688, and is provided hereinbelow with reference to the sequence listing part.

[41694] VGAM2983 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41695] An enzyme complex designated DICER COMPLEX, dices the VGAM2983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2983 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2983 RNA is designated SEQ ID:5758, and is provided hereinbelow with reference to the sequence listing part.

[41696] VGAM2983 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2983 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2983 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41697] VGAM2983 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2983 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM2983 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2983 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2983 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41698] The complementary binding of VGAM2983 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2983 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2983 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM2983 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41699] It is appreciated that VGAM2983 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2983 host target genes. The mRNA of each one of this plurality of VGAM2983 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2983 RNA, herein designated VGAM RNA, and which when bound by VGAM2983 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2983 host target proteins.

[41700] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2983 gene, herein designated VGAM GENE, on one or more VGAM2983 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41701] It is yet further appreciated that a function of VGAM2983 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2983 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2983 correlate with, and may be deduced from, the identity of the host target genes which VGAM2983 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41702] Nucleotide sequences of the VGAM2983 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2983 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2983 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2983 are further

described hereinbelow with reference to Table 1.

[41703] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2983 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41704] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2984 (VGAM2984) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41705] VGAM2984 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2984 was detected is described hereinabove with reference to Figs. 2-8.

[41706] VGAM2984 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 3. VGAM2984 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41707] VGAM2984 gene, herein designated VGAM GENE, encodes a VGAM2984 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2984 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2984 precursor RNA is designated SEQ ID:2691, and is provided hereinbelow with reference to the sequence listing part.

[41708] VGAM2984 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41709] An enzyme complex designated DICER COMPLEX, dices the VGAM2984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2984 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2984 RNA is designated SEQ ID:5761, and is provided hereinbelow with reference to the sequence listing part.

[41710] VGAM2984 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41711] VGAM2984 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2984 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2984 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41712] The complementary binding of VGAM2984 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2984 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2984 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41713] It is appreciated that VGAM2984 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2984 host target genes. The mRNA of each one of this plurality of VGAM2984 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2984 RNA, herein designated VGAM RNA, and which when bound by VGAM2984 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2984 host target proteins.

[41714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2984 gene, herein designated VGAM GENE, on one or more VGAM2984 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41715] It is yet further appreciated that a function of VGAM2984 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2984 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 3. Specific functions, and accordingly utilities, of VGAM2984 correlate with, and may be deduced from, the identity of the host target genes which VGAM2984 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41716] Nucleotide sequences of the VGAM2984 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2984 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2984 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2984 are further described hereinbelow with reference to Table 1.

[41717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2984 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41718] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2985 (VGAM2985) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41719] VGAM2985 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2985 was detected is described hereinabove with reference to Figs. 2-8.

[41720] VGAM2985 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cherry mottle leaf virus. VGAM2985 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41721] VGAM2985 gene, herein designated VGAM GENE, encodes

a VGAM2985 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2985 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2985 precursor RNA is designated SEQ ID:2689, and is provided hereinbelow with reference to the sequence listing part.

[41722] VGAM2985 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41723] An enzyme complex designated DICER COMPLEX, dices the VGAM2985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2985 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2985 RNA is designated SEQ ID:5759, and is provided hereinbelow with reference to the sequence listing part.

[41724] VGAM2985 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41725] VGAM2985 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2985 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2985 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41726] The complementary binding of VGAM2985 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2985 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2985 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[41727] It is appreciated that VGAM2985 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2985 host target genes. The mRNA of each one of this plurality of VGAM2985 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2985 RNA, herein designated VGAM RNA, and which when bound by VGAM2985 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2985 host target proteins.

[41728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2985 gene, herein designated VGAM GENE, on one or more VGAM2985 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41729] It is yet further appreciated that a function of VGAM2985 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2985 include diagnosis, prevention and treatment of viral infection by Cherry mottle leaf virus. Specific functions, and accordingly utilities, of VGAM2985 correlate with, and may be deduced from, the identity of the host target genes which VGAM2985 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41730] Nucleotide sequences of the VGAM2985 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2985 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2985 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2985 are further described hereinbelow with reference to Table 1.

[41731] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2985 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41732] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2986 (VGAM2986) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41733] VGAM2986 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2986 was detected is described hereinabove with reference to Figs. 2-8.

[41734] VGAM2986 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Little cherry virus. VGAM2986 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41735] VGAM2986 gene, herein designated VGAM GENE, encodes a VGAM2986 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2986 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2986 precursor RNA is designated SEQ ID:2690, and is provided hereinbelow with reference to the sequence listing part.

[41736] VGAM2986 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41737] An enzyme complex designated DICER COMPLEX, dices the VGAM2986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2986 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2986 RNA is designated SEQ ID:5760, and is provided hereinbelow with reference to the sequence listing part.

[41738] VGAM2986 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41739] VGAM2986 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2986 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2986 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41740] The complementary binding of VGAM2986 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2986 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2986 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41741] It is appreciated that VGAM2986 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2986 host target genes. The mRNA of each one of this plurality of VGAM2986 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2986 RNA, herein designated VGAM RNA, and which when bound by VGAM2986 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2986 host target proteins.

[41742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2986 gene, herein designated VGAM GENE, on one or more VGAM2986 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41743] It is yet further appreciated that a function of VGAM2986 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2986 include diagnosis, prevention and treatment of viral infection by Little cherry virus. Specific functions, and accordingly utilities, of VGAM2986 correlate with, and may be deduced from, the identity of the host target genes which VGAM2986 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41744] Nucleotide sequences of the VGAM2986 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2986 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2986 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2986 are further described hereinbelow with reference to Table 1.

[41745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2986 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41746] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2987 (VGAM2987) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41747] VGAM2987 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2987 was detected is described hereinabove with reference to Figs. 2-8.

[41748] VGAM2987 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice yellow stunt virus. VGAM2987 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41749] VGAM2987 gene, herein designated VGAM GENE, encodes a VGAM2987 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM2987 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2987 precursor RNA is designated SEQ ID:1145, and is provided hereinbelow with reference to the sequence listing part.

[41750] VGAM2987 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41751] An enzyme complex designated DICER COMPLEX, dices the VGAM2987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2987 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM2987 RNA is designated SEQ ID:4215, and is provided hereinbelow with reference to the sequence listing part.

[41752] VGAM2987 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41753] VGAM2987 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2987 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2987 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41754] The complementary binding of VGAM2987 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2987 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2987 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41755] It is appreciated that VGAM2987 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2987 host target genes. The mRNA of each one of this plurality of VGAM2987 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2987 RNA, herein designated VGAM RNA, and which when bound by VGAM2987 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2987 host target proteins.

[41756] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2987 gene, herein designated VGAM GENE, on one or more VGAM2987 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41757] It is yet further appreciated that a function of VGAM2987 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2987 include diagnosis, prevention and treatment of viral infection by Rice yellow stunt virus. Specific functions, and accordingly utilities, of VGAM2987 correlate with, and may be deduced from, the identity of the host target genes which VGAM2987 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41758] Nucleotide sequences of the VGAM2987 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2987 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2987 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2987 are further described hereinbelow with reference to Table 1.

[41759] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM2987 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41760] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2988 (VGAM2988) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41761] VGAM2988 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2988 was detected is described hereinabove with reference to Figs. 2-8.

[41762] VGAM2988 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lymphocystis disease virus 1. VGAM2988 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41763] VGAM2988 gene, herein designated VGAM GENE, encodes a VGAM2988 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2988 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2988 precursor RNA is designated SEQ ID:1153, and is provided hereinbelow with reference to the sequence listing part.

[41764] VGAM2988 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41765] An enzyme complex designated DICER COMPLEX, dices the VGAM2988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2988 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2988 RNA is designated SEQ ID:4223, and is provided hereinbelow with reference to the sequence listing part.

[41766] VGAM2988 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41767] VGAM2988 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2988 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2988 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41768] The complementary binding of VGAM2988 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2988 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2988 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41769] It is appreciated that VGAM2988 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM2988 host target genes. The mRNA of each one of this plurality of VGAM2988 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2988 RNA, herein designated VGAM RNA, and which when bound by VGAM2988 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2988 host target proteins.

[41770] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2988 gene, herein designated VGAM GENE, on one or more VGAM2988 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41771] It is yet further appreciated that a function of VGAM2988 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2988 include diagnosis, prevention and treatment of viral infection by Lymphocystis disease virus 1. Specific functions, and accordingly utilities, of VGAM2988 correlate with, and may be deduced from, the identity of the host target genes which VGAM2988 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41772] Nucleotide sequences of the VGAM2988 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2988 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2988 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2988 are further described hereinbelow with reference to Table 1.

[41773] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM2988 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41774] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2989 (VGAM2989) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41775] VGAM2989 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2989 was detected is described hereinabove with reference to Figs. 2-8.

[41776] VGAM2989 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 1. VGAM2989 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41777] VGAM2989 gene, herein designated VGAM GENE, encodes a VGAM2989 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2989 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2989 precursor RNA is designated SEQ ID:1154, and is provided hereinbelow with reference to the sequence listing part.

[41778] VGAM2989 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41779] An enzyme complex designated DICER COMPLEX, dices the VGAM2989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2989 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM2989 RNA is designated SEQ ID:4224, and is provided hereinbelow with reference to the sequence listing part.

[41780] VGAM2989 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41781] VGAM2989 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2989 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2989 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41782] The complementary binding of VGAM2989 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2989 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2989 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41783] It is appreciated that VGAM2989 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2989 host target genes. The mRNA of

each one of this plurality of VGAM2989 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2989 RNA, herein designated VGAM RNA, and which when bound by VGAM2989 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2989 host target proteins.

[41784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2989 gene, herein designated VGAM GENE, on one or more VGAM2989 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[41785] It is yet further appreciated that a function of VGAM2989 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2989 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2989 correlate with, and may be deduced from, the identity of the host target genes which VGAM2989 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41786] Nucleotide sequences of the VGAM2989 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2989 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2989 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2989 are further described hereinbelow with reference to Table 1.

[41787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2989 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[41788] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2990 (VGAM2990) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41789] VGAM2990 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2990 was detected is described hereinabove with reference to Figs. 2-8.

[41790] VGAM2990 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM2990 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41791] VGAM2990 gene, herein designated VGAM GENE, encodes a VGAM2990 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2990 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM2990 precursor RNA is designated SEQ ID:1155, and is provided hereinbelow with reference to the sequence listing part.

[41792] VGAM2990 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41793] An enzyme complex designated DICER COMPLEX, dices the VGAM2990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2990 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2990 RNA is designated SEQ ID:4225, and

is provided hereinbelow with reference to the sequence listing part.

[41794] VGAM2990 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41795] VGAM2990 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2990 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2990 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41796] The complementary binding of VGAM2990 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2990 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2990 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41797] It is appreciated that VGAM2990 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2990 host target genes. The mRNA of each one of this plurality of VGAM2990 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2990 RNA, herein designated VGAM RNA, and which when bound by VGAM2990 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2990 host target proteins.

[41798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2990 gene, herein designated VGAM GENE, on one or more VGAM2990 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41799] It is yet further appreciated that a function of VGAM2990 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2990 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM2990

correlate with, and may be deduced from, the identity of the host target genes which VGAM2990 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41800] Nucleotide sequences of the VGAM2990 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2990 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2990 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2990 are further described hereinbelow with reference to Table 1.

[41801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2990 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41802] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2991 (VGAM2991) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[41803] VGAM2991 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2991 was detected is described hereinabove with reference to Figs. 2-8.

[41804] VGAM2991 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM2991 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41805] VGAM2991 gene, herein designated VGAM GENE, encodes a VGAM2991 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2991 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2991 precursor RNA is designated SEQ ID:1156, and is provided hereinbelow with reference to the sequence listing part.

[41806] VGAM2991 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41807] An enzyme complex designated DICER COMPLEX, dices the VGAM2991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2991 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2991 RNA is designated SEQ ID:4226, and is provided hereinbelow with reference to the sequence listing part.

[41808] VGAM2991 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41809] VGAM2991 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2991 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2991 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41810] The complementary binding of VGAM2991 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2991 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2991 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41811] It is appreciated that VGAM2991 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2991 host target genes. The mRNA of each one of this plurality of VGAM2991 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2991 RNA, herein designated VGAM RNA, and which when bound by VGAM2991 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2991 host target proteins.

[41812] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2991 gene, herein designated VGAM GENE, on one or more VGAM2991 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41813] It is yet further appreciated that a function of VGAM2991 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2991 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM2991 correlate with, and may be deduced

from, the identity of the host target genes which VGAM2991 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41814] Nucleotide sequences of the VGAM2991 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2991 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2991 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2991 are further described hereinbelow with reference to Table 1.

[41815] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2991 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41816] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2992 (VGAM2992) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41817] VGAM2992 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2992 was detected is described hereinabove with reference to Figs. 2-8.

[41818] VGAM2992 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2992 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41819] VGAM2992 gene, herein designated VGAM GENE, encodes a VGAM2992 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2992 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2992 precursor RNA is designated SEQ ID:2692, and is provided hereinbelow with reference to the sequence listing part.

[41820] VGAM2992 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41821] An enzyme complex designated DICER COMPLEX, dices the VGAM2992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2992 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2992 RNA is designated SEQ ID:5762, and is provided hereinbelow with reference to the sequence listing part.

[41822] VGAM2992 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41823] VGAM2992 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2992 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2992 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41824] The complementary binding of VGAM2992 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2992 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2992 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41825] It is appreciated that VGAM2992 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2992 host target genes. The mRNA of each one of this plurality of VGAM2992 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2992 RNA, herein designated VGAM RNA, and which when bound by VGAM2992 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2992 host target proteins.

[41826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM2992 gene, herein designated VGAM GENE, on one or more VGAM2992 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41827] It is yet further appreciated that a function of VGAM2992 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2992 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2992 correlate with, and may be deduced from, the identity of the host target genes which VGAM2992 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[41828] Nucleotide sequences of the VGAM2992 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2992 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2992 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2992 are further described hereinbelow with reference to Table 1.

[41829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2992 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41830] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2993 (VGAM2993) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41831] VGAM2993 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2993 was detected is described hereinabove with reference to Figs. 2-8.

[41832] VGAM2993 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sida golden mosaic virus. VGAM2993 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41833] VGAM2993 gene, herein designated VGAM GENE, encodes a VGAM2993 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2993 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2993 precursor RNA is designated SEQ ID:2693, and is provided hereinbelow with reference to the sequence listing part.

[41834] VGAM2993 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41835] An enzyme complex designated DICER COMPLEX, dices the VGAM2993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2993 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2993 RNA is designated SEQ ID:5763, and is provided hereinbelow with reference to the sequence listing part.

[41836] VGAM2993 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41837] VGAM2993 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2993 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2993 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[41838] The complementary binding of VGAM2993 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2993 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2993 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41839] It is appreciated that VGAM2993 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2993 host target genes. The mRNA of each one of this plurality of VGAM2993 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2993 RNA, herein designated VGAM RNA, and which when bound by VGAM2993 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2993 host target proteins.

[41840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM2993 gene, herein designated VGAM GENE, on one or more VGAM2993 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41841] It is yet further appreciated that a function of VGAM2993 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2993 include diagnosis, prevention and treatment of viral infection by Sida golden mosaic virus. Specific functions, and accordingly utilities, of VGAM2993 correlate with, and may be deduced from, the identity of the host target genes which VGAM2993 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[41842] Nucleotide sequences of the VGAM2993 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2993 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2993 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2993 are further described hereinbelow with reference to Table 1.

[41843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2993 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41844] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2994 (VGAM2994) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41845] VGAM2994 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM2994 was detected is described hereinabove with reference to Figs. 2-8.

[41846] VGAM2994 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass mottle virus. VGAM2994 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41847] VGAM2994 gene, herein designated VGAM GENE, encodes a VGAM2994 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2994 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2994 precursor RNA is designated SEQ ID:1146, and is provided hereinbelow with reference to the sequence listing part.

[41848] VGAM2994 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41849] An enzyme complex designated DICER COMPLEX, dices the VGAM2994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2994 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2994 RNA is designated SEQ ID:4216, and is provided hereinbelow with reference to the sequence listing part.

[41850] VGAM2994 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[41851] VGAM2994 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2994 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2994 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41852] The complementary binding of VGAM2994 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2994 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2994 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41853] It is appreciated that VGAM2994 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2994 host target genes. The mRNA of each one of this plurality of VGAM2994 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2994 RNA, herein designated VGAM RNA, and which when bound by VGAM2994 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2994 host target proteins.

[41854] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2994 gene, herein designated VGAM GENE, on one

or more VGAM2994 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41855] It is yet further appreciated that a function of VGAM2994 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2994 include diagnosis, prevention and treatment of viral infection by Ryegrass mottle virus. Specific functions, and accordingly utilities, of VGAM2994 correlate with, and may be deduced from, the identity of the host target genes which VGAM2994 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41856] Nucleotide sequences of the VGAM2994 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2994 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2994 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2994 are further described hereinbelow with reference to Table 1.

[41857] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2994 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41858] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2995 (VGAM2995) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41859] VGAM2995 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2995 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[41860] VGAM2995 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM2995 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41861] VGAM2995 gene, herein designated VGAM GENE, encodes a VGAM2995 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2995 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2995 precursor RNA is designated SEQ ID:1147, and is provided hereinbelow with reference to the sequence listing part.

[41862] VGAM2995 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41863] An enzyme complex designated DICER COMPLEX, dices the VGAM2995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2995 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2995 RNA is designated SEQ ID:4217, and is provided hereinbelow with reference to the sequence listing part.

[41864] VGAM2995 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41865] VGAM2995 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2995 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2995 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41866] The complementary binding of VGAM2995 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2995 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2995 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41867] It is appreciated that VGAM2995 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2995 host target genes. The mRNA of each one of this plurality of VGAM2995 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2995 RNA, herein designated VGAM RNA, and which when bound by VGAM2995 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2995 host target proteins.

[41868] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2995 gene, herein designated VGAM GENE, on one or more VGAM2995 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41869] It is yet further appreciated that a function of VGAM2995 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2995 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM2995 correlate with, and may be deduced from, the identity of the host target genes which VGAM2995 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41870] Nucleotide sequences of the VGAM2995 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM2995 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2995 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2995 are further described hereinbelow with reference to Table 1.

[41871] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2995 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41872] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2996 (VGAM2996) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41873] VGAM2996 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2996 was detected is described hereinabove with reference to Figs. 2-8.

[41874] VGAM2996 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 5. VGAM2996 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41875] VGAM2996 gene, herein designated VGAM GENE, encodes a VGAM2996 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2996 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2996 precursor RNA is designated SEQ ID:1148, and is provided hereinbelow with reference to the sequence listing part.

[41876] VGAM2996 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[41877] An enzyme complex designated DICER COMPLEX, dices the VGAM2996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2996 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2996 RNA is designated SEQ ID:4218, and is provided hereinbelow with reference to the sequence listing part.

[41878] VGAM2996 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41879] VGAM2996 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2996 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2996 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41880] The complementary binding of VGAM2996 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2996 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2996 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41881] It is appreciated that VGAM2996 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2996 host target genes. The mRNA of each one of this plurality of VGAM2996 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2996 RNA, herein designated VGAM RNA, and which when bound by VGAM2996 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2996 host target proteins.

[41882] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2996 gene, herein designated VGAM GENE, on one or more VGAM2996 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41883] It is yet further appreciated that a function of VGAM2996 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2996 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2996 correlate with, and may be deduced from, the identity of the host target genes which VGAM2996 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41884] Nucleotide sequences of the VGAM2996 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM2996 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2996 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2996 are further described hereinbelow with reference to Table 1.

[41885] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2996 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41886] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2997 (VGAM2997) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41887] VGAM2997 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2997 was detected is described hereinabove with reference to Figs. 2-8.

[41888] VGAM2997 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human herpesvirus 5. VGAM2997 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41889] VGAM2997 gene, herein designated VGAM GENE, encodes a VGAM2997 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2997 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2997 precursor RNA is designated SEQ ID:1149, and is provided hereinbelow with reference to the sequence listing part.

[41890] VGAM2997 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41891] An enzyme complex designated DICER COMPLEX, dices the VGAM2997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2997 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2997 RNA is designated SEQ ID:4219, and is provided hereinbelow with reference to the sequence listing part.

[41892] VGAM2997 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2997 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2997 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41893] VGAM2997 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM2997 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2997 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2997 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2997 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41894] The complementary binding of VGAM2997 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2997 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2997 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2997 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41895] It is appreciated that VGAM2997 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2997 host target genes. The mRNA of each one of this plurality of VGAM2997 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2997 RNA, herein designated VGAM RNA, and which when bound by VGAM2997 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2997 host target proteins.

[41896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2997 gene, herein designated VGAM GENE, on one or more VGAM2997 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41897] It is yet further appreciated that a function of VGAM2997 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2997 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 5. Specific functions, and accordingly utilities, of VGAM2997 correlate with, and may be deduced from, the identity of the host target genes which VGAM2997 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41898] Nucleotide sequences of the VGAM2997 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2997 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM2997 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2997 are further described hereinbelow with reference to Table 1.

[41899] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2997 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41900] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2998 (VGAM2998) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41901] VGAM2998 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2998 was detected is described hereinabove with reference to Figs. 2-8.

[41902] VGAM2998 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cactus virus X.

VGAM2998 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41903] VGAM2998 gene, herein designated VGAM GENE, encodes a VGAM2998 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2998 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2998 precursor RNA is designated SEQ ID:1150, and is provided hereinbelow with reference to the sequence listing part.

[41904] VGAM2998 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41905] An enzyme complex designated DICER COMPLEX, dices

the VGAM2998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM2998 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM2998 RNA is designated SEQ ID:4220, and is provided hereinbelow with reference to the sequence listing part.

[41906] VGAM2998 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2998 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2998 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41907] VGAM2998 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2998 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM2998 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2998 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2998 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41908] The complementary binding of VGAM2998 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2998 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM2998 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2998 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41909] It is appreciated that VGAM2998 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2998 host target genes. The mRNA of each one of this plurality of VGAM2998 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2998 RNA, herein designated VGAM RNA, and which when bound by VGAM2998 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2998 host target proteins.

[41910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2998 gene, herein designated VGAM GENE, on one or more VGAM2998 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41911] It is yet further appreciated that a function of VGAM2998 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2998 include diagnosis, prevention and treatment of viral infection by Cactus virus X. Specific functions, and accordingly utilities, of VGAM2998 correlate with, and may be deduced from, the identity of the host target genes which VGAM2998 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41912] Nucleotide sequences of the VGAM2998 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2998 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM2998 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM2998 are further described hereinbelow with reference to Table 1.

[41913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2998 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41914] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 2999 (VGAM2999) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41915] VGAM2999 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM2999 was detected is described hereinabove with reference to Figs. 2-8.

[41916] VGAM2999 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM2999 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[41917] VGAM2999 gene, herein designated VGAM GENE, encodes a VGAM2999 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM2999 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM2999 precursor RNA is designated SEQ ID:1157, and is provided hereinbelow with reference to the sequence listing part.

[41918] VGAM2999 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM2999 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41919] An enzyme complex designated DICER COMPLEX, dices the VGAM2999 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM2999 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM2999 RNA is designated SEQ ID:4227, and is provided hereinbelow with reference to the sequence listing part.

[41920] VGAM2999 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM2999 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM2999 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41921] VGAM2999 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM2999 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM2999 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM2999 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM2999 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41922] The complementary binding of VGAM2999 RNA, herein designated VGAM RNA, to host target binding sites on VGAM2999 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM2999

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM2999 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41923] It is appreciated that VGAM2999 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM2999 host target genes. The mRNA of each one of this plurality of VGAM2999 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM2999 RNA, herein designated VGAM RNA, and which when bound by VGAM2999 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM2999 host target proteins.

[41924] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM2999 gene, herein designated VGAM GENE, on one or more VGAM2999 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41925] It is yet further appreciated that a function of VGAM2999 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM2999 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM2999 correlate with, and may be deduced from, the identity of the host target genes which VGAM2999 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41926] Nucleotide sequences of the VGAM2999 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM2999 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM2999 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM2999 are further described hereinbelow with reference to Table 1.

[41927] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM2999 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41928] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3000 (VGAM3000) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41929] VGAM3000 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3000 was detected is described hereinabove with reference to Figs. 2-8.

[41930] VGAM3000 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3000 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[41931] VGAM3000 gene, herein designated VGAM GENE, encodes a VGAM3000 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3000 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3000 precursor RNA is designated SEQ ID:1158, and is provided hereinbelow with reference to the sequence listing part.

[41932] VGAM3000 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41933] An enzyme complex designated DICER COMPLEX, dices the VGAM3000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3000 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3000 RNA is designated SEQ ID:4228, and is provided hereinbelow with reference to the sequence listing part.

[41934] VGAM3000 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3000 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3000 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41935] VGAM3000 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3000 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3000 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3000 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3000 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41936] The complementary binding of VGAM3000 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3000 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3000 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3000 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41937] It is appreciated that VGAM3000 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3000 host target genes. The mRNA of each one of this plurality of VGAM3000 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3000 RNA, herein designated VGAM RNA, and which when bound by VGAM3000 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3000 host target proteins.

[41938] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3000 gene, herein designated VGAM GENE, on one or more VGAM3000 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41939] It is yet further appreciated that a function of VGAM3000 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3000 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3000 correlate with, and may be deduced from, the identity of the host target genes which VGAM3000 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41940] Nucleotide sequences of the VGAM3000 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3000 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3000 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3000 are further

described hereinbelow with reference to Table 1.

[41941] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3000 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41942] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3001 (VGAM3001) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41943] VGAM3001 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3001 was detected is described hereinabove with reference to Figs. 2-8.

[41944] VGAM3001 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox virus. VGAM3001 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41945] VGAM3001 gene, herein designated VGAM GENE, encodes a VGAM3001 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3001 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3001 precursor RNA is designated SEQ ID:1151, and is provided hereinbelow with reference to the sequence listing part.

[41946] VGAM3001 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41947] An enzyme complex designated DICER COMPLEX, dices the VGAM3001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3001 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3001 RNA is designated SEQ ID:4221, and is provided hereinbelow with reference to the sequence listing part.

[41948] VGAM3001 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41949] VGAM3001 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3001 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3001 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41950] The complementary binding of VGAM3001 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3001 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3001 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41951] It is appreciated that VGAM3001 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3001 host target genes. The mRNA of each one of this plurality of VGAM3001 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3001 RNA, herein designated VGAM RNA, and which when bound by VGAM3001 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3001 host target proteins.

[41952] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3001 gene, herein designated VGAM GENE, on one or more VGAM3001 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41953] It is yet further appreciated that a function of VGAM3001 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3001 include diagnosis, prevention and treatment of viral infection by Swinepox virus. Specific functions, and accordingly utilities, of VGAM3001 correlate with, and may be deduced from, the identity of the host target genes which VGAM3001 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41954] Nucleotide sequences of the VGAM3001 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3001 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3001 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3001 are further described hereinbelow with reference to Table 1.

[41955] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3001 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41956] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3002 (VGAM3002) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41957] VGAM3002 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3002 was detected is described hereinabove with reference to Figs. 2-8.

[41958] VGAM3002 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3002 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41959] VGAM3002 gene, herein designated VGAM GENE, encodes

a VGAM3002 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3002 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3002 precursor RNA is designated SEQ ID:1152, and is provided hereinbelow with reference to the sequence listing part.

[41960] VGAM3002 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41961] An enzyme complex designated DICER COMPLEX, dices the VGAM3002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3002 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3002 RNA is designated SEQ ID:4222, and is provided hereinbelow with reference to the sequence listing part.

[41962] VGAM3002 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41963] VGAM3002 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3002 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3002 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41964] The complementary binding of VGAM3002 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3002 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3002 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[41965] It is appreciated that VGAM3002 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3002 host target genes. The mRNA of each one of this plurality of VGAM3002 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3002 RNA, herein designated VGAM RNA, and which when bound by VGAM3002 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3002 host target proteins.

[41966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3002 gene, herein designated VGAM GENE, on one or more VGAM3002 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41967] It is yet further appreciated that a function of VGAM3002 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3002 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3002 correlate with, and may be deduced from, the identity of the host target genes which VGAM3002 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41968] Nucleotide sequences of the VGAM3002 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3002 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3002 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3002 are further described hereinbelow with reference to Table 1.

[41969] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3002 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41970] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3003 (VGAM3003) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41971] VGAM3003 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3003 was detected is described hereinabove with reference to Figs. 2-8.

[41972] VGAM3003 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 1. VGAM3003 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41973] VGAM3003 gene, herein designated VGAM GENE, encodes a VGAM3003 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3003 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3003 precursor RNA is designated SEQ ID:1160, and is provided hereinbelow with reference to the sequence listing part.

[41974] VGAM3003 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41975] An enzyme complex designated DICER COMPLEX, dices the VGAM3003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3003 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3003 RNA is designated SEQ ID:4230, and is provided hereinbelow with reference to the sequence listing part.

[41976] VGAM3003 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41977] VGAM3003 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3003 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3003 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41978] The complementary binding of VGAM3003 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3003 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3003 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41979] It is appreciated that VGAM3003 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3003 host target genes. The mRNA of each one of this plurality of VGAM3003 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3003 RNA, herein designated VGAM RNA, and which when bound by VGAM3003 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3003 host target proteins.

[41980] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3003 gene, herein designated VGAM GENE, on one or more VGAM3003 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41981] It is yet further appreciated that a function of VGAM3003 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3003 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3003 correlate with, and may be deduced from, the identity of the host target genes which VGAM3003 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41982] Nucleotide sequences of the VGAM3003 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3003 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3003 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3003 are further described hereinbelow with reference to Table 1.

[41983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3003 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41984] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3004 (VGAM3004) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41985] VGAM3004 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3004 was detected is described hereinabove with reference to Figs. 2-8.

[41986] VGAM3004 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Zucchini yellow mosaic virus. VGAM3004 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[41987] VGAM3004 gene, herein designated VGAM GENE, encodes a VGAM3004 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3004 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3004 precursor RNA is designated SEQ ID:1167, and is provided hereinbelow with reference to the sequence listing part.

[41988] VGAM3004 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[41989] An enzyme complex designated DICER COMPLEX, dices the VGAM3004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3004 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3004 RNA is designated SEQ ID:4237, and is provided hereinbelow with reference to the sequence listing part.

[41990] VGAM3004 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[41991] VGAM3004 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3004 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3004 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[41992] The complementary binding of VGAM3004 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3004 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3004 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[41993] It is appreciated that VGAM3004 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3004 host target genes. The mRNA of each one of this plurality of VGAM3004 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3004 RNA, herein designated VGAM RNA, and which when bound by VGAM3004 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3004 host target proteins.

[41994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3004 gene, herein designated VGAM GENE, on one or more VGAM3004 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[41995] It is yet further appreciated that a function of VGAM3004 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3004 include diagnosis, prevention and treatment of viral infection by Zucchini yellow mosaic virus. Specific functions, and accordingly utilities, of VGAM3004 correlate with, and may be deduced from, the identity of the host target genes which VGAM3004 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[41996] Nucleotide sequences of the VGAM3004 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3004 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3004 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3004 are further described hereinbelow with reference to Table 1.

[41997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3004 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[41998] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3005 (VGAM3005) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[41999] VGAM3005 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3005 was detected is described hereinabove with reference to Figs. 2-8.

[42000] VGAM3005 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3005 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42001] VGAM3005 gene, herein designated VGAM GENE, encodes a VGAM3005 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3005 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3005 precursor RNA is designated SEQ ID:1159, and is provided hereinbelow with reference to the sequence listing part.

[42002] VGAM3005 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42003] An enzyme complex designated DICER COMPLEX, dices the VGAM3005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3005 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3005 RNA is designated SEQ ID:4229, and is provided hereinbelow with reference to the sequence listing part.

[42004] VGAM3005 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42005] VGAM3005 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3005 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3005 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42006] The complementary binding of VGAM3005 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3005 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3005 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42007] It is appreciated that VGAM3005 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3005 host target genes. The mRNA of each one of this plurality of VGAM3005 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3005 RNA, herein designated VGAM RNA, and which when bound by VGAM3005 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3005 host target proteins.

[42008] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3005 gene, herein designated VGAM GENE, on one or more VGAM3005 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42009] It is yet further appreciated that a function of VGAM3005 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3005 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3005 correlate with, and may be deduced from, the identity of the host target genes which VGAM3005 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42010] Nucleotide sequences of the VGAM3005 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3005 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3005 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3005 are further described hereinbelow with reference to Table 1.

[42011] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3005 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42012] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3006 (VGAM3006) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42013] VGAM3006 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3006 was detected is described hereinabove with reference to Figs. 2-8.

[42014] VGAM3006 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid herpesvirus 3. VGAM3006 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42015] VGAM3006 gene, herein designated VGAM GENE, encodes a VGAM3006 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3006 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-

code a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3006 precursor RNA is designated SEQ ID:1168, and is provided hereinbelow with reference to the sequence listing part.

[42016] VGAM3006 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42017] An enzyme complex designated DICER COMPLEX, dices the VGAM3006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3006 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide se-

quence of VGAM3006 RNA is designated SEQ ID:4238, and is provided hereinbelow with reference to the sequence listing part.

[42018] VGAM3006 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42019] VGAM3006 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3006 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is ap-

preciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3006 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42020] The complementary binding of VGAM3006 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3006 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3006 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42021] It is appreciated that VGAM3006 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3006 host target genes. The mRNA of

each one of this plurality of VGAM3006 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3006 RNA, herein designated VGAM RNA, and which when bound by VGAM3006 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3006 host target proteins.

[42022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3006 gene, herein designated VGAM GENE, on one or more VGAM3006 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science

294,779 (2001)).

[42023] It is yet further appreciated that a function of VGAM3006 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3006 include diagnosis, prevention and treatment of viral infection by Gallid herpesvirus 3. Specific functions, and accordingly utilities, of VGAM3006 correlate with, and may be deduced from, the identity of the host target genes which VGAM3006 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42024] Nucleotide sequences of the VGAM3006 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3006 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3006 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3006 are further described hereinbelow with reference to Table 1.

[42025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3006 RNA, herein designated VGAM RNA, are de-

scribed hereinbelow with reference to Table 2.

[42026] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3007 (VGAM3007) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42027] VGAM3007 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3007 was detected is described hereinabove with reference to Figs. 2-8.

[42028] VGAM3007 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory syncytial virus. VGAM3007 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42029] VGAM3007 gene, herein designated VGAM GENE, encodes a VGAM3007 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3007 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly

similar to the nucleotide sequence of VGAM3007 precursor RNA is designated SEQ ID:1161, and is provided hereinbelow with reference to the sequence listing part.

[42030] VGAM3007 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42031] An enzyme complex designated DICER COMPLEX, dices the VGAM3007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3007 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3007 RNA is designated SEQ ID:4231, and

is provided hereinbelow with reference to the sequence listing part.

[42032] VGAM3007 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42033] VGAM3007 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3007 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites

shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3007 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42034] The complementary binding of VGAM3007 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3007 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3007 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42035] It is appreciated that VGAM3007 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3007 host target genes. The mRNA of each one of this plurality of VGAM3007 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3007 RNA, herein designated VGAM RNA, and which when bound by VGAM3007 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3007 host target proteins.

[42036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3007 gene, herein designated VGAM GENE, on one or more VGAM3007 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42037] It is yet further appreciated that a function of VGAM3007 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3007 include diagnosis, prevention and treatment of viral infection by Respiratory syncytial virus. Specific functions, and accordingly utilities, of VGAM3007 correlate with, and may be deduced from, the identity of the host target genes which VGAM3007 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42038] Nucleotide sequences of the VGAM3007 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3007 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3007 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3007 are further described hereinbelow with reference to Table 1.

[42039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3007 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42040] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3008 (VGAM3008) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42041] VGAM3008 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3008 was detected is described hereinabove with reference to Figs. 2-8.

[42042] VGAM3008 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3008 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42043] VGAM3008 gene, herein designated VGAM GENE, encodes a VGAM3008 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3008 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3008 precur-

sor RNA is designated SEQ ID:1169, and is provided hereinbelow with reference to the sequence listing part.

[42044] VGAM3008 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42045] An enzyme complex designated DICER COMPLEX, dices the VGAM3008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3008 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3008 RNA is designated SEQ ID:4239, and is provided hereinbelow with reference to the sequence

listing part.

[42046] VGAM3008 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42047] VGAM3008 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3008 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not

meant to be limiting VGAM3008 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42048] The complementary binding of VGAM3008 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3008 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3008 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42049] It is appreciated that VGAM3008 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3008 host target genes. The mRNA of each one of this plurality of VGAM3008 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM3008 RNA, herein designated VGAM RNA, and which when bound by VGAM3008 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3008 host target proteins.

[42050] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3008 gene, herein designated VGAM GENE, on one or more VGAM3008 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42051] It is yet further appreciated that a function of VGAM3008

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3008 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3008 correlate with, and may be deduced from, the identity of the host target genes which VGAM3008 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42052] Nucleotide sequences of the VGAM3008 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3008 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3008 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3008 are further described hereinbelow with reference to Table 1.

[42053] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3008 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42054] Fig. 1 further provides a conceptual description of another

novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3009 (VGAM3009) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42055] VGAM3009 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3009 was detected is described hereinabove with reference to Figs. 2-8.

[42056] VGAM3009 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox virus.
VGAM3009 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42057] VGAM3009 gene, herein designated VGAM GENE, encodes a VGAM3009 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3009 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3009 precursor RNA is designated SEQ ID:1170, and is provided here-

inbelow with reference to the sequence listing part.

[42058] VGAM3009 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42059] An enzyme complex designated DICER COMPLEX, dices the VGAM3009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3009 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3009 RNA is designated SEQ ID:4240, and is provided hereinbelow with reference to the sequence listing part.

[42060] VGAM3009 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42061] VGAM3009 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3009 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3009 RNA, herein designated

VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42062] The complementary binding of VGAM3009 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3009 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3009 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42063] It is appreciated that VGAM3009 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3009 host target genes. The mRNA of each one of this plurality of VGAM3009 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM3009 RNA, herein designated VGAM RNA, and which when bound by VGAM3009 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3009 host target proteins.

[42064] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3009 gene, herein designated VGAM GENE, on one or more VGAM3009 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42065] It is yet further appreciated that a function of VGAM3009 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3009 include diagnosis, prevention and treatment of viral infection by Cowpox virus. Specific functions, and accordingly utilities, of VGAM3009 correlate with, and may be deduced from, the identity of the host target genes which VGAM3009 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42066] Nucleotide sequences of the VGAM3009 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3009 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3009 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3009 are further described hereinbelow with reference to Table 1.

[42067] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3009 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42068] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present

invention, referred to here as Viral Genomic Address Messenger 3010 (VGAM3010) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42069] VGAM3010 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3010 was detected is described hereinabove with reference to Figs. 2-8.

[42070] VGAM3010 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia virus. VGAM3010 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42071] VGAM3010 gene, herein designated VGAM GENE, encodes a VGAM3010 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3010 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3010 precursor RNA is designated SEQ ID:1162, and is provided hereinbelow with reference to the sequence listing part.

[42072] VGAM3010 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42073] An enzyme complex designated DICER COMPLEX, dices the VGAM3010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3010 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3010 RNA is designated SEQ ID:4232, and is provided hereinbelow with reference to the sequence listing part.

[42074] VGAM3010 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42075] VGAM3010 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3010 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3010 RNA, herein designated VGAM RNA, may have a different number of host target

binding sites in untranslated regions of a VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42076] The complementary binding of VGAM3010 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3010 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3010 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42077] It is appreciated that VGAM3010 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3010 host target genes. The mRNA of each one of this plurality of VGAM3010 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3010 RNA, herein designated VGAM

RNA, and which when bound by VGAM3010 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3010 host target proteins.

[42078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3010 gene, herein designated VGAM GENE, on one or more VGAM3010 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42079] It is yet further appreciated that a function of VGAM3010 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM3010 include diagnosis, prevention and treatment of viral infection by Vaccinia virus. Specific functions, and accordingly utilities, of VGAM3010 correlate with, and may be deduced from, the identity of the host target genes which VGAM3010 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42080] Nucleotide sequences of the VGAM3010 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3010 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3010 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3010 are further described hereinbelow with reference to Table 1.

[42081] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3010 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42082] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Mes-

senger 3011 (VGAM3011) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42083] VGAM3011 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3011 was detected is described hereinabove with reference to Figs. 2-8.

[42084] VGAM3011 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3011 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42085] VGAM3011 gene, herein designated VGAM GENE, encodes a VGAM3011 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3011 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3011 precursor RNA is designated SEQ ID:1163, and is provided hereinbelow with reference to the sequence listing part.

[42086] VGAM3011 precursor RNA, herein designated VGAM PRE-

CURSOR RNA, folds onto itself, forming VGAM3011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42087] An enzyme complex designated DICER COMPLEX, dices the VGAM3011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3011 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3011 RNA is designated SEQ ID:4233, and is provided hereinbelow with reference to the sequence listing part.

[42088] VGAM3011 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM3011 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3011 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42089] VGAM3011 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3011 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3011 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3011 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3011 host

target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42090] The complementary binding of VGAM3011 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3011 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3011 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3011 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42091] It is appreciated that VGAM3011 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3011 host target genes. The mRNA of each one of this plurality of VGAM3011 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3011 RNA, herein designated VGAM RNA, and which when bound by VGAM3011 RNA, herein

designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3011 host target proteins.

[42092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3011 gene, herein designated VGAM GENE, on one or more VGAM3011 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42093] It is yet further appreciated that a function of VGAM3011 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3011 include diagnosis, prevention and

treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3011 correlate with, and may be deduced from, the identity of the host target genes which VGAM3011 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42094] Nucleotide sequences of the VGAM3011 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3011 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3011 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3011 are further described hereinbelow with reference to Table 1.

[42095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3011 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42096] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3012 (VGAM3012) viral gene, which modulates ex-

pression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42097] VGAM3012 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3012 was detected is described hereinabove with reference to Figs. 2-8.

[42098] VGAM3012 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tupaia herpesvirus. VGAM3012 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42099] VGAM3012 gene, herein designated VGAM GENE, encodes a VGAM3012 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3012 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3012 precursor RNA is designated SEQ ID:1164, and is provided hereinbelow with reference to the sequence listing part.

[42100] VGAM3012 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3012 folded

precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42101] An enzyme complex designated DICER COMPLEX, dices the VGAM3012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3012 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3012 RNA is designated SEQ ID:4234, and is provided hereinbelow with reference to the sequence listing part.

[42102] VGAM3012 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3012 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM3012 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42103] VGAM3012 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3012 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3012 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3012 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3012 host target RNA, herein designated VGAM HOST TARGET RNA.

It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42104] The complementary binding of VGAM3012 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3012 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3012 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3012 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42105] It is appreciated that VGAM3012 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3012 host target genes. The mRNA of each one of this plurality of VGAM3012 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3012 RNA, herein designated VGAM RNA, and which when bound by VGAM3012 RNA, herein designated VGAM RNA, causes inhibition of translation of

respective one or more VGAM3012 host target proteins.

[42106] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3012 gene, herein designated VGAM GENE, on one or more VGAM3012 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42107] It is yet further appreciated that a function of VGAM3012 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3012 include diagnosis, prevention and treatment of viral infection by Tupaia herpesvirus. Specific

functions, and accordingly utilities, of VGAM3012 correlate with, and may be deduced from, the identity of the host target genes which VGAM3012 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42108] Nucleotide sequences of the VGAM3012 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3012 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3012 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3012 are further described hereinbelow with reference to Table 1.

[42109] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3012 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42110] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3013 (VGAM3013) viral gene, which modulates expression of respective host target genes thereof, the func-

tion and utility of which host target genes is known in the art.

[42111] VGAM3013 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3013 was detected is described hereinabove with reference to Figs. 2-8.

[42112] VGAM3013 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine herpesvirus 4. VGAM3013 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42113] VGAM3013 gene, herein designated VGAM GENE, encodes a VGAM3013 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3013 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3013 precursor RNA is designated SEQ ID:1165, and is provided hereinbelow with reference to the sequence listing part.

[42114] VGAM3013 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3013 folded precursor RNA, herein designated VGAM FOLDED PRECUR-

SOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42115] An enzyme complex designated DICER COMPLEX, dices the VGAM3013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3013 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3013 RNA is designated SEQ ID:4235, and is provided hereinbelow with reference to the sequence listing part.

[42116] VGAM3013 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3013 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3013 host target RNA,

herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42117] VGAM3013 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3013 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3013 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3013 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3013 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host tar-

get binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42118] The complementary binding of VGAM3013 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3013 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3013 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3013 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42119] It is appreciated that VGAM3013 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3013 host target genes. The mRNA of each one of this plurality of VGAM3013 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3013 RNA, herein designated VGAM RNA, and which when bound by VGAM3013 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3013 host target proteins.

[42120] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3013 gene, herein designated VGAM GENE, on one or more VGAM3013 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42121] It is yet further appreciated that a function of VGAM3013 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3013 include diagnosis, prevention and treatment of viral infection by Equine herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3013

correlate with, and may be deduced from, the identity of the host target genes which VGAM3013 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42122] Nucleotide sequences of the VGAM3013 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3013 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3013 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3013 are further described hereinbelow with reference to Table 1.

[42123] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3013 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42124] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3014 (VGAM3014) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the

art.

[42125] VGAM3014 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3014 was detected is described hereinabove with reference to Figs. 2-8.

[42126] VGAM3014 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3014 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42127] VGAM3014 gene, herein designated VGAM GENE, encodes a VGAM3014 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3014 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3014 precursor RNA is designated SEQ ID:1166, and is provided hereinbelow with reference to the sequence listing part.

[42128] VGAM3014 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure.

As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42129] An enzyme complex designated DICER COMPLEX, dices the VGAM3014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3014 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3014 RNA is designated SEQ ID:4236, and is provided hereinbelow with reference to the sequence listing part.

[42130] VGAM3014 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA, comprises

three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42131] VGAM3014 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3014 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3014 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an

example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42132] The complementary binding of VGAM3014 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3014 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3014 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42133] It is appreciated that VGAM3014 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3014 host target genes. The mRNA of each one of this plurality of VGAM3014 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3014 RNA, herein designated VGAM RNA, and which when bound by VGAM3014 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3014 host target proteins.

[42134] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3014 gene, herein designated VGAM GENE, on one or more VGAM3014 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42135] It is yet further appreciated that a function of VGAM3014 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3014 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3014 correlate with, and may be deduced from, the identity of the

host target genes which VGAM3014 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42136] Nucleotide sequences of the VGAM3014 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3014 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3014 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3014 are further described hereinbelow with reference to Table 1.

[42137] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3014 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42138] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3015 (VGAM3015) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42139] VGAM3015 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3015 was detected is described hereinabove with reference to Figs. 2-8.

[42140] VGAM3015 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma virus. VGAM3015 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42141] VGAM3015 gene, herein designated VGAM GENE, encodes a VGAM3015 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3015 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3015 precursor RNA is designated SEQ ID:1174, and is provided hereinbelow with reference to the sequence listing part.

[42142] VGAM3015 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typi-

cal of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42143] An enzyme complex designated DICER COMPLEX, dices the VGAM3015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3015 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3015 RNA is designated SEQ ID:4244, and is provided hereinbelow with reference to the sequence listing part.

[42144] VGAM3015 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding

gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42145] VGAM3015 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3015 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3015 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be lo-

cated in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42146] The complementary binding of VGAM3015 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3015 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3015 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42147] It is appreciated that VGAM3015 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3015 host target genes. The mRNA of each one of this plurality of VGAM3015 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3015 RNA, herein designated VGAM RNA, and which when bound by VGAM3015 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3015 host target proteins.

[42148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM3015 gene, herein designated VGAM GENE, on one or more VGAM3015 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42149] It is yet further appreciated that a function of VGAM3015 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3015 include diagnosis, prevention and treatment of viral infection by Myxoma virus. Specific functions, and accordingly utilities, of VGAM3015 correlate with, and may be deduced from, the identity of the host target genes which VGAM3015 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[42150] Nucleotide sequences of the VGAM3015 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3015 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3015 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3015 are further described hereinbelow with reference to Table 1.

[42151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3015 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42152] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3016 (VGAM3016) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42153] VGAM3016 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3016 was detected is described hereinabove with reference to Figs. 2-8.

[42154] VGAM3016 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3016 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42155] VGAM3016 gene, herein designated VGAM GENE, encodes a VGAM3016 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3016 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3016 precursor RNA is designated SEQ ID:1171, and is provided hereinbelow with reference to the sequence listing part.

[42156] VGAM3016 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the

fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42157] An enzyme complex designated DICER COMPLEX, dices the VGAM3016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3016 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3016 RNA is designated SEQ ID:4241, and is provided hereinbelow with reference to the sequence listing part.

[42158] VGAM3016 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and

a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42159] VGAM3016 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3016 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3016 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both

3UTR and 5UTR regions.

[42160] The complementary binding of VGAM3016 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3016 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3016 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42161] It is appreciated that VGAM3016 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3016 host target genes. The mRNA of each one of this plurality of VGAM3016 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3016 RNA, herein designated VGAM RNA, and which when bound by VGAM3016 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3016 host target proteins.

[42162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM3016 gene, herein designated VGAM GENE, on one or more VGAM3016 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42163] It is yet further appreciated that a function of VGAM3016 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3016 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3016 correlate with, and may be deduced from, the identity of the host target genes which VGAM3016 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[42164] Nucleotide sequences of the VGAM3016 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3016 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3016 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3016 are further described hereinbelow with reference to Table 1.

[42165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3016 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42166] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3017 (VGAM3017) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42167] VGAM3017 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM3017 was detected is described hereinabove with reference to Figs. 2-8.

[42168] VGAM3017 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine herpesvirus 1. VGAM3017 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42169] VGAM3017 gene, herein designated VGAM GENE, encodes a VGAM3017 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3017 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3017 precursor RNA is designated SEQ ID:1172, and is provided hereinbelow with reference to the sequence listing part.

[42170] VGAM3017 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the

RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42171] An enzyme complex designated DICER COMPLEX, dices the VGAM3017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3017 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3017 RNA is designated SEQ ID:4242, and is provided hereinbelow with reference to the sequence listing part.

[42172] VGAM3017 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN COD-

ING and 3UTR respectively.

[42173] VGAM3017 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3017 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3017 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42174] The complementary binding of VGAM3017 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3017 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3017 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42175] It is appreciated that VGAM3017 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3017 host target genes. The mRNA of each one of this plurality of VGAM3017 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3017 RNA, herein designated VGAM RNA, and which when bound by VGAM3017 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3017 host target proteins.

[42176] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3017 gene, herein designated VGAM GENE, on one

or more VGAM3017 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42177] It is yet further appreciated that a function of VGAM3017 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3017 include diagnosis, prevention and treatment of viral infection by Bovine herpesvirus 1. Specific functions, and accordingly utilities, of VGAM3017 correlate with, and may be deduced from, the identity of the host target genes which VGAM3017 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42178] Nucleotide sequences of the VGAM3017 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3017 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3017 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3017 are further described hereinbelow with reference to Table 1.

[42179] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3017 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42180]

[42181] Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3018 (VGAM3018) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42182] VGAM3018 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3018 was detected is de-

scribed hereinabove with reference to Figs. 2-8.

[42183] VGAM3018 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Okra enation virus. VGAM3018 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42184] VGAM3018 gene, herein designated VGAM GENE, encodes a VGAM3018 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3018 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3018 precursor RNA is designated SEQ ID:1173, and is provided hereinbelow with reference to the sequence listing part.

[42185] VGAM3018 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial

inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42186] An enzyme complex designated DICER COMPLEX, dices the VGAM3018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3018 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3018 RNA is designated SEQ ID:4243, and is provided hereinbelow with reference to the sequence listing part.

[42187] VGAM3018 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42188] VGAM3018 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3018 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3018 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42189] The complementary binding of VGAM3018 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3018 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3018 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42190] It is appreciated that VGAM3018 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3018 host target genes. The mRNA of each one of this plurality of VGAM3018 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3018 RNA, herein designated VGAM RNA, and which when bound by VGAM3018 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3018 host target proteins.

[42191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3018 gene, herein designated VGAM GENE, on one or more VGAM3018 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42192] It is yet further appreciated that a function of VGAM3018 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3018 include diagnosis, prevention and treatment of viral infection by Okra enation virus. Specific functions, and accordingly utilities, of VGAM3018 correlate with, and may be deduced from, the identity of the host target genes which VGAM3018 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42193] Nucleotide sequences of the VGAM3018 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the diced VGAM3018 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3018 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3018 are further described hereinbelow with reference to Table 1.

[42194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3018 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42195] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3019 (VGAM3019) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42196] VGAM3019 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3019 was detected is described hereinabove with reference to Figs. 2-8.

[42197] VGAM3019 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3019 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42198] VGAM3019 gene, herein designated VGAM GENE, encodes a VGAM3019 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3019 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3019 precursor RNA is designated SEQ ID:1175, and is provided hereinbelow with reference to the sequence listing part.

[42199] VGAM3019 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of

the second half thereof.

[42200] An enzyme complex designated DICER COMPLEX, dices the VGAM3019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3019 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3019 RNA is designated SEQ ID:4245, and is provided hereinbelow with reference to the sequence listing part.

[42201] VGAM3019 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42202] VGAM3019 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3019 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3019 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42203] The complementary binding of VGAM3019 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3019 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3019 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42204] It is appreciated that VGAM3019 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3019 host target genes. The mRNA of each one of this plurality of VGAM3019 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3019 RNA, herein designated VGAM RNA, and which when bound by VGAM3019 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3019 host target proteins.

[42205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3019 gene, herein designated VGAM GENE, on one or more VGAM3019 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42206] It is yet further appreciated that a function of VGAM3019 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3019 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3019 correlate with, and may be deduced from, the identity of the host target genes which VGAM3019 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42207] Nucleotide sequences of the VGAM3019 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

diced VGAM3019 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3019 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3019 are further described hereinbelow with reference to Table 1.

[42208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3019 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42209] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3020 (VGAM3020) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42210] VGAM3020 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3020 was detected is described hereinabove with reference to Figs. 2-8.

[42211] VGAM3020 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Wheat streak mosaic virus. VGAM3020 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42212] VGAM3020 gene, herein designated VGAM GENE, encodes a VGAM3020 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3020 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3020 precursor RNA is designated SEQ ID:1176, and is provided hereinbelow with reference to the sequence listing part.

[42213] VGAM3020 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42214] An enzyme complex designated DICER COMPLEX, dices the VGAM3020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3020 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3020 RNA is designated SEQ ID:4246, and is provided hereinbelow with reference to the sequence listing part.

[42215] VGAM3020 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3020 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3020 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42216] VGAM3020 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM3020 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3020 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3020 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3020 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42217] The complementary binding of VGAM3020 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3020 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3020 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3020 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42218] It is appreciated that VGAM3020 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3020 host target genes. The mRNA of each one of this plurality of VGAM3020 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3020 RNA, herein designated VGAM RNA, and which when bound by VGAM3020 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3020 host target proteins.

[42219] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3020 gene, herein designated VGAM GENE, on one or more VGAM3020 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42220] It is yet further appreciated that a function of VGAM3020 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3020 include diagnosis, prevention and treatment of viral infection by Wheat streak mosaic virus. Specific functions, and accordingly utilities, of VGAM3020 correlate with, and may be deduced from, the identity of the host target genes which VGAM3020 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42221] Nucleotide sequences of the VGAM3020 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3020 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM3020 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3020 are further described hereinbelow with reference to Table 1.

[42222] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3020 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42223] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3021 (VGAM3021) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42224] VGAM3021 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3021 was detected is described hereinabove with reference to Figs. 2-8.

[42225] VGAM3021 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai virus. VGAM3021

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42226] VGAM3021 gene, herein designated VGAM GENE, encodes a VGAM3021 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3021 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3021 precursor RNA is designated SEQ ID:1177, and is provided hereinbelow with reference to the sequence listing part.

[42227] VGAM3021 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3021 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42228] An enzyme complex designated DICER COMPLEX, dices the VGAM3021 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, into VGAM3021 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3021 RNA is designated SEQ ID:4247, and is provided hereinbelow with reference to the sequence listing part.

[42229] VGAM3021 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3021 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3021 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42230] VGAM3021 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3021 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM3021 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3021 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3021 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42231] The complementary binding of VGAM3021 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3021 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3021

host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3021 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42232] It is appreciated that VGAM3021 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3021 host target genes. The mRNA of each one of this plurality of VGAM3021 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3021 RNA, herein designated VGAM RNA, and which when bound by VGAM3021 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3021 host target proteins.

[42233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3021 gene, herein designated VGAM GENE, on one or more VGAM3021 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42234] It is yet further appreciated that a function of VGAM3021 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3021 include diagnosis, prevention and treatment of viral infection by Sendai virus. Specific functions, and accordingly utilities, of VGAM3021 correlate with, and may be deduced from, the identity of the host target genes which VGAM3021 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42235] Nucleotide sequences of the VGAM3021 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3021 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3021 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM3021 are further described hereinbelow with reference to Table 1.

[42236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3021 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42237] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3022 (VGAM3022) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42238] VGAM3022 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3022 was detected is described hereinabove with reference to Figs. 2-8.

[42239] VGAM3022 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl adenovirus D. VGAM3022 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[42240] VGAM3022 gene, herein designated VGAM GENE, encodes a VGAM3022 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3022 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3022 precursor RNA is designated SEQ ID:1178, and is provided hereinbelow with reference to the sequence listing part.

[42241] VGAM3022 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42242] An enzyme complex designated DICER COMPLEX, dices the VGAM3022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3022 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3022 RNA is designated SEQ ID:4248, and is provided hereinbelow with reference to the sequence listing part.

[42243] VGAM3022 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3022 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3022 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42244] VGAM3022 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3022 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM3022 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3022 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3022 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42245] The complementary binding of VGAM3022 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3022 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3022 host target RNA, herein designated VGAM HOST TARGET

RNA, into VGAM3022 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42246] It is appreciated that VGAM3022 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3022 host target genes. The mRNA of each one of this plurality of VGAM3022 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3022 RNA, herein designated VGAM RNA, and which when bound by VGAM3022 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3022 host target proteins.

[42247] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3022 gene, herein designated VGAM GENE, on one or more VGAM3022 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42248] It is yet further appreciated that a function of VGAM3022 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3022 include diagnosis, prevention and treatment of viral infection by Fowl adenovirus D. Specific functions, and accordingly utilities, of VGAM3022 correlate with, and may be deduced from, the identity of the host target genes which VGAM3022 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42249] Nucleotide sequences of the VGAM3022 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3022 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3022 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3022 are further

described hereinbelow with reference to Table 1.

[42250] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3022 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42251] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3023 (VGAM3023) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42252] VGAM3023 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3023 was detected is described hereinabove with reference to Figs. 2-8.

[42253] VGAM3023 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Paramecium bursaria Chlorella virus 1. VGAM3023 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42254] VGAM3023 gene, herein designated VGAM GENE, encodes a VGAM3023 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3023 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3023 precursor RNA is designated SEQ ID:1179, and is provided hereinbelow with reference to the sequence listing part.

[42255] VGAM3023 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42256] An enzyme complex designated DICER COMPLEX, dices the VGAM3023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3023 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3023 RNA is designated SEQ ID:4249, and is provided hereinbelow with reference to the sequence listing part.

[42257] VGAM3023 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42258] VGAM3023 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3023 RNA, herein designated

VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3023 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42259] The complementary binding of VGAM3023 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3023 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3023 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42260] It is appreciated that VGAM3023 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3023 host target genes. The mRNA of each one of this plurality of VGAM3023 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3023 RNA, herein designated VGAM RNA, and which when bound by VGAM3023 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3023 host target proteins.

[42261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3023 gene, herein designated VGAM GENE, on one or more VGAM3023 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42262] It is yet further appreciated that a function of VGAM3023 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3023 include diagnosis, prevention and treatment of viral infection by Paramecium bursaria Chlorella virus 1. Specific functions, and accordingly utilities, of VGAM3023 correlate with, and may be deduced from, the identity of the host target genes which VGAM3023 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42263] Nucleotide sequences of the VGAM3023 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3023 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3023 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3023 are further described hereinbelow with reference to Table 1.

[42264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3023 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42265] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3024 (VGAM3024) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42266] VGAM3024 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3024 was detected is described hereinabove with reference to Figs. 2-8.

[42267] VGAM3024 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious spleen and kidney necrosis virus. VGAM3024 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42268] VGAM3024 gene, herein designated VGAM GENE, encodes

a VGAM3024 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3024 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3024 precursor RNA is designated SEQ ID:1180, and is provided hereinbelow with reference to the sequence listing part.

[42269] VGAM3024 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42270] An enzyme complex designated DICER COMPLEX, dices the VGAM3024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3024 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3024 RNA is designated SEQ ID:4250, and is provided hereinbelow with reference to the sequence listing part.

[42271] VGAM3024 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42272] VGAM3024 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3024 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed

sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3024 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42273] The complementary binding of VGAM3024 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3024 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3024 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[42274] It is appreciated that VGAM3024 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3024 host target genes. The mRNA of each one of this plurality of VGAM3024 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3024 RNA, herein designated VGAM RNA, and which when bound by VGAM3024 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3024 host target proteins.

[42275] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3024 gene, herein designated VGAM GENE, on one or more VGAM3024 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42276] It is yet further appreciated that a function of VGAM3024 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3024 include diagnosis, prevention and treatment of viral infection by Infectious spleen and kidney necrosis virus. Specific functions, and accordingly utilities, of VGAM3024 correlate with, and may be deduced from, the identity of the host target genes which VGAM3024 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42277] Nucleotide sequences of the VGAM3024 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3024 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3024 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3024 are further described hereinbelow with reference to Table 1.

[42278] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3024 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42279] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3025 (VGAM3025) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42280] VGAM3025 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3025 was detected is described hereinabove with reference to Figs. 2-8.

[42281] VGAM3025 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rat cytomegalovirus. VGAM3025 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42282] VGAM3025 gene, herein designated VGAM GENE, encodes a VGAM3025 precursor RNA, herein designated VGAM

PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3025 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3025 precursor RNA is designated SEQ ID:1181, and is provided hereinbelow with reference to the sequence listing part.

[42283] VGAM3025 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42284] An enzyme complex designated DICER COMPLEX, dices the VGAM3025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3025 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 28%) nucleotide sequence of VGAM3025 RNA is designated SEQ ID:4251, and is provided hereinbelow with reference to the sequence listing part.

[42285] VGAM3025 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42286] VGAM3025 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3025 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host

target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3025 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42287] The complementary binding of VGAM3025 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3025 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3025 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42288] It is appreciated that VGAM3025 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3025 host target genes. The mRNA of each one of this plurality of VGAM3025 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3025 RNA, herein designated VGAM RNA, and which when bound by VGAM3025 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3025 host target proteins.

[42289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3025 gene, herein designated VGAM GENE, on one or more VGAM3025 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42290] It is yet further appreciated that a function of VGAM3025 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3025 include diagnosis, prevention and treatment of viral infection by Rat cytomegalovirus. Specific functions, and accordingly utilities, of VGAM3025 correlate with, and may be deduced from, the identity of the host target genes which VGAM3025 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42291] Nucleotide sequences of the VGAM3025 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3025 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3025 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3025 are further described hereinbelow with reference to Table 1.

[42292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites to VGAM3025 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42293] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3026 (VGAM3026) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42294] VGAM3026 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3026 was detected is described hereinabove with reference to Figs. 2-8.

[42295] VGAM3026 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human herpesvirus 4. VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42296] VGAM3026 gene, herein designated VGAM GENE, encodes a VGAM3026 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and un-

like most ordinary genes, VGAM3026 precursor RNA, herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3026 precursor RNA is designated SEQ ID:1182, and is provided hereinbelow with reference to the sequence listing part.

[42297] VGAM3026 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42298] An enzyme complex designated DICER COMPLEX, dices the VGAM3026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3026 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM3026 RNA is designated SEQ ID:4252, and is provided hereinbelow with reference to the sequence listing part.

[42299] VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42300] VGAM3026 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3026 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3

such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3026 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42301] The complementary binding of VGAM3026 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3026 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3026 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42302] It is appreciated that VGAM3026 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM3026 host target genes. The mRNA of each one of this plurality of VGAM3026 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3026 RNA, herein designated VGAM RNA, and which when bound by VGAM3026 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3026 host target proteins.

[42303] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3026 gene, herein designated VGAM GENE, on one or more VGAM3026 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42304] It is yet further appreciated that a function of VGAM3026 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3026 include diagnosis, prevention and treatment of viral infection by Human herpesvirus 4. Specific functions, and accordingly utilities, of VGAM3026 correlate with, and may be deduced from, the identity of the host target genes which VGAM3026 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42305] Nucleotide sequences of the VGAM3026 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3026 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3026 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3026 are further described hereinbelow with reference to Table 1.

[42306] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the

complementarity of each of these host target binding sites to VGAM3026 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42307] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3027 (VGAM3027) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42308] VGAM3027 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3027 was detected is described hereinabove with reference to Figs. 2-8.

[42309] VGAM3027 gene, herein designated VGAM GENE, is a viral gene contained in the genome of African swine fever virus. VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42310] VGAM3027 gene, herein designated VGAM GENE, encodes a VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3027 precursor RNA,

herein designated VGAM PRECURSOR RNA, does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM3027 precursor RNA is designated SEQ ID:1188, and is provided hereinbelow with reference to the sequence listing part.

[42311] VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA, folds onto itself, forming VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional hairpin structure. As is well known in the art, this hairpin structure, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[42312] An enzyme complex designated DICER COMPLEX, dices the VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, into VGAM3027 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, dicing of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 35%) nucleotide sequence of VGAM3027 RNA is designated SEQ ID:4258, and is provided hereinbelow with reference to the sequence listing part.

[42313] VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, comprises three regions, as is typical of mRNA of a protein coding gene: a 5 untranslated region, a protein coding region and a 3 untranslated region, designated 5UTR, PROTEIN CODING and 3UTR respectively.

[42314] VGAM3027 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM3027 RNA, herein designated VGAM RNA, is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows 3 such host target binding sites, designated BINDING SITE I,

BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting VGAM3027 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3UTR region, this is meant as an example only these host target binding sites may be located in the 3UTR region, the 5UTR region, or in both 3UTR and 5UTR regions.

[42315] The complementary binding of VGAM3027 RNA, herein designated VGAM RNA, to host target binding sites on VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM3027 host target RNA, herein designated VGAM HOST TARGET RNA, into VGAM3027 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[42316] It is appreciated that VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM3027 host target genes. The mRNA of each one of this plurality of VGAM3027 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM3027 RNA, herein designated VGAM RNA, and which when bound by VGAM3027 RNA, herein designated VGAM RNA, causes inhibition of translation of respective one or more VGAM3027 host target proteins.

[42317] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM3027 gene, herein designated VGAM GENE, on one or more VGAM3027 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

Perspective: Glimpses of a tiny RNA world, Science 294,779 (2001)).

[42318] It is yet further appreciated that a function of VGAM3027 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM3027 include diagnosis, prevention and treatment of viral infection by African swine fever virus. Specific functions, and accordingly utilities, of VGAM3027 correlate with, and may be deduced from, the identity of the host target genes which VGAM3027 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[42319] Nucleotide sequences of the VGAM3027 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the diced VGAM3027 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM3027 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM3027 are further described hereinbelow with reference to Table 1.

[42320] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on, and schematic representation of the complementarity of each of these host target binding sites

to VGAM3027 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[42321] Fig. 1 further provides a conceptual description of another novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 3028 (VGAM3028) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[42322] VGAM3028 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM3028 was detected is described hereinabove with reference to Figs. 2-8.

[42323] VGAM3028 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee cytomegalovirus. VGAM3028 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[42324] VGAM3028 gene, herein designated VGAM GENE, encodes a VGAM3028 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM3028 precursor RNA, herein designated VGAM PRECURSOR RNA, does not en-
